## B4.2 Functional Analysis II - Sheet 2 of 4

Read the remaining of Chapter 1, Chapter 2 and prove the few statements whose proofs were left out as an exercise. (Not to be handed in.)

Do:

**Q**1. Let X be a Hilbert space and  $A \in \mathcal{B}(X)$ .

- (a) Prove that  $\operatorname{Ker} A = (\operatorname{Im} A^*)^{\perp}$  and  $(\operatorname{Ker} A)^{\perp} = \overline{\operatorname{Im} A^*}$ .
- (b) Assume that A is a projection, i.e.  $A^2 = A$ . Show that Im A is closed. Prove that

$$A = A^* \iff (\operatorname{Im} A)^{\perp} = \operatorname{Ker} A \iff ||A|| \le 1.$$

Deduce that either ||A|| = 1 or A = 0 provided that one of the above statements is true.

[Hint: To prove that  $||A|| \leq 1$  implies  $A = A^*$ , show that, for every given point in Im(I-A), the origin is the point in ImA which is closest to that given point, and then use Q3 of Sheet 1 to show that ImA and Im(I-A) are orthogonal complementary spaces.]

**Q**2. Let X be a Hilbert space and  $U: X \to X$  be a unitary operator.

- (a) Show that  $Ker(I U) = Ker(I U^*);$
- (b) Show that  $X = \overline{\text{Im}(I U)} \oplus \text{Ker}(I U);$
- (c) Show that  $\lim_{N\to\infty} \frac{1}{N} \sum_{n=1}^{N-1} U^n x = x$  if  $x \in \text{Ker}(I-U)$  and  $\lim_{N\to\infty} \frac{1}{N} \sum_{n=1}^{N-1} U^n x = 0$  if  $x \in \overline{\text{Im}(I-U)}$ ;
- (d) Deduce that, for each  $x \in X$ ,

$$\lim_{N \to \infty} \frac{1}{N} \sum_{n=1}^{N-1} U^n x = Px,$$

where P is the orthogonal projection onto Ker(I-U).

**Q**3. Let X be a Hilbert space and let  $T \in \mathcal{B}(X)$ .

- (a) Prove that  $\operatorname{Ker} TT^* = \operatorname{Ker} T^* = (\operatorname{Im} T)^{\perp}$ .
- (b) Assume that T is normal, i.e.  $T^*T = TT^*$ . Prove that  $\overline{\operatorname{Im} T} = \overline{\operatorname{Im} T^*}$ .
- (c) Prove that T is normal if and only if  $||Tx|| = ||T^*x||$  for all  $x \in X$ .

Q4. Let M be a complete metric space and, for each  $n \in \mathbb{N}$ , let  $A_n$  be a nowhere dense subset of M and  $G_n$  be a dense open subset of M. Show that  $\bigcap_{n \in \mathbb{N}} G_n$  is not contained in  $\bigcup_{n \in \mathbb{N}} A_n$ .

Deduce that  $\mathbb{Q}$  is not the intersection of a countable number of open subsets of  $\mathbb{R}$ .

- **Q**5. In this question, all sequence spaces are real.
  - (a) Consider a double sequence  $(a_{n,j})$  such that for every fixed n, the sequence  $(a_{n,j})_{j=1}^{\infty}$  belongs to  $c_0$ . Suppose that

$$\sup_{n} \sum_{j} a_{n,j} b_{j} < \infty \text{ for every } b = (b_{j}) \in \ell^{1}.$$

Show that  $\sup_{n,j} |a_{n,j}| < \infty$ .

- (b) Suppose that  $(a_j)$  is a scalar sequence such that  $\sum_j a_j b_j$  converges for all  $b = (b_j) \in c_0$ . Prove that  $\sum_j |a_j|$  converges. [Hint: Consider the sequences  $T_n$  with entries  $T_n(j) = a_j$  if  $j \leq n$  and  $T_n(j) = 0$  if j > n. Use the principle of uniform boundedness to show that  $(T_n)$  is bounded in  $\ell^1$ .]
- (c\*) (Optional) Let  $2 and let <math>(c_{m,n})$  be a double sequence such that, for every fixed m,

$$\sum_{n} c_{m,n} a_n b_n \text{ converges for every } a = (a_n), b = (b_n) \in \ell^p$$

and

$$\sup_{m} \sum_{n} c_{m,n} a_n b_n < \infty \text{ for every } a = (a_n), b = (b_n) \in \ell^p.$$

Prove that, for  $q = \frac{p}{p-2}$ ,

$$\sup_{m} \sum_{n} |c_{m,n}|^{q} < \infty.$$

**Q**6. (a) Let X be a real Banach space, Y and Z be real normed vector spaces, and  $B: X \times Y \to Z$  be bilinear (i.e., linear in each variable). Suppose that for each  $x \in X$  and  $y \in Y$ , the linear maps  $B^x: Y \to Z$  and  $B_y: X \to Z$  defined

$$B^x(y) = B(x, y) = B_y(x)$$

are continuous. Use the principle of uniform boundedness to prove that there exists a constant K such that  $||B(x,y)|| \le K||x|| ||y||$  for all  $x \in X$  and  $y \in Y$ . Deduce that B is continuous.

(b) Let X and Y both be the subspace of  $L^1(0,1)$  consisting of polynomials,  $Z=\mathbb{R},$  and

$$B(f,g) = \int_{0}^{1} fgdt.$$

Show that the bilinear form B is continuous in each variables but it is not continuous.

[To put things in perspective, please note that even on  $\mathbb{R}^2$ , for nonlinear functions, separate continuity does not imply joint continuity. A standard example is the function  $f(x,y)=\frac{xy}{x^2+y^2}$  for  $(x,y)\neq 0$  and f(0,0)=0.]
