My C3.4 Algebraic geometry notes (see C2.1 course webpage) try to fill the gap between classical algebraic geometry (C3.4) and C2.1 / or my website

Prerequisites

Commutative algebra (e.g. Atiyah - MacDonald, Introduction to Comm. Alg.)

Category theory — or willingness to read things up as necessary

Homological algebra — or willingness to read things up as necessary

Expectations

That you read the notes and the main reference regularly after each class.

Not everything can be covered in detail in class, so you need to be willing to look things up as necessary.

Conventions

Diagrams commute unless we say otherwise

Ring means commutative ring with unit 1.

0.1 Classical Algebraic Geometry : Affine varieties

$R = k[x_1, \dots, x_n]$ polynomial ring over algebraically closed field k

$I \subseteq R$ ideal

$X = V(I) = \{a \in k^n : f(a) = 0 \ \forall f \in I\}$ affine variety

The topological space

Affine space: $\mathbb{A}^n = k^n$ with Zariski topology: $\left\{ \begin{array}{l} \text{closed sets: } V(I) \\ \text{open sets: } U_I = \mathbb{A}^n \setminus V(I) \\ \text{basis of open sets: } D_f = \bigcup_{f \in I} D_f \end{array} \right.$

$X \subseteq \mathbb{A}^n$ subspace topology: $X \cap U_I$

$D_f = \{a \in k^n : f(a) \neq 0\}, f \in R$

The functions on it

$R \cong \text{Hom}(\mathbb{A}^n, \mathbb{A}^1), f \mapsto (a \mapsto f(a))$

$\mathbb{I}(X) = \{f \in R : f(X) = 0\}$

Remark $V(\mathbb{I}(X)) = X$ for affine varieties X

Coordinate ring: $k[X] = R/\mathbb{I}(X)$

← The functions on \mathbb{A}^n are polynomial functions.
← The functions on \mathbb{A}^n vanishing on X

← The functions on X are polynomials in the coordinates

Key facts: 1) Hilbert's basis theorem: R Noetherian, so $k[X]$ Noetherian

2) Hilbert's weak nullstellensatz: maximal ideals of R (and of $k[X]$) are $m_a = \mathbb{I}(\{a\}) = \langle x_1 - a_1, \dots, x_n - a_n \rangle$, so correspond to points: $\{a\} = V(m_a)$

3) Hilbert's Nullstellensatz: $\mathbb{I}(V(I)) = \sqrt{I}$ (radical of I) $\left| \begin{array}{l} \text{Hence:} \\ \mathbb{I}V(I) = I \\ \text{if } I \text{ is} \\ \text{radical} \end{array} \right.$ ($\{f : \exists N, f^N \in I\}$)

Lemma There are enough functions to separate points

Pf $a \neq b \in X \subseteq \mathbb{A}^n \Rightarrow$ some coordinate $a_i \neq b_i \Rightarrow x_i \in k[X]$ separates a, b . \square

Morphisms between affine varieties

$\text{Hom}(\mathbb{A}^n, \mathbb{A}^m) \cong R^m \leftarrow$ polynomial maps $a \mapsto (f_1(a), \dots, f_m(a))$

$\text{Hom}(X, Y) =$ restriction of a polynomial map $\mathbb{A}^n \rightarrow \mathbb{A}^m$ s.t. $X \rightarrow Y$

Facts: 1) $k[X] \cong \text{Hom}(X, \mathbb{A}^1) \leftarrow$ "values of functions are enough to determine the abstract function"

2) $\text{Hom}(X, Y) \cong \text{Hom}_{k\text{-alg}}(k[Y], k[X])$

$(F: X \rightarrow Y) \mapsto (F^*: \text{Hom}(Y, \mathbb{A}^1) \rightarrow \text{Hom}(X, \mathbb{A}^1)) \leftarrow$ "pullback"
 $f \mapsto F^*f = f \circ F$

Equivalence of categories

$\{\text{affine varieties}\} \longleftrightarrow \{\text{finitely generated reduced } k\text{-algebras} \ \& \ \text{homs of } k\text{-algs.}\}$

$X \longmapsto k[X]$
 $(F: X \rightarrow Y) \longmapsto F^*$
↑ no nilpotents
(f nilpotent if $f^N = 0$ some N)

Recall:
 R/J reduced
 $\Leftrightarrow J$ radical
Note: $\mathbb{I}(X)$ is radical

Remark The "same" (up to isomorphism) X can be embedded in various \mathbb{A}^n .

E.g. cuspidal cubic $V(y^2 - x^3) = \text{---} \subseteq \mathbb{A}^2_{x,y}$ is $\cong V(y^2 - x^3, z - x) \subseteq \mathbb{A}^3_{x,y,z}$

0.2 Why schemes?

Some reasons:

- 1) Why always have spaces embedded in \mathbb{A}^n ? (extrinsic)
Can you make sense of X without reference to \mathbb{A}^n ? (intrinsic)
- 2) Why not let R be any ring?
- 3) When you deform varieties, nilpotents arise naturally and should not be ignored:

$$f = (x-a) \cdot (x-b)$$

$$X = \mathbb{V}(f) = \{a, b\} \subseteq \mathbb{A}^1$$

← two points

$$k[X] \cong k[x] / (x-a) \oplus k[x] / (x-b) \cong k^2$$

← a value at each point

Deform: a, b become 0:

$$f = (x-0) \cdot (x-0) = x^2$$

$$X = \mathbb{V}(f) = \{0\} \subseteq \mathbb{A}^1$$

$\mathbb{V}(\sqrt{x^2}) = \sqrt{x^2}$ by Hilbert Nullstell.

$$k[X] \cong k[x] / \sqrt{x^2} = k[x] / (x) \cong k$$

notice $k[X]$ is the reduced ring, not $k[x] / (x^2)$

We lost information: classically you cannot tell $x=0$ apart from $x^2=0$

In the theory of schemes, the key role is not played by the topological space.

The key role is played by the ring of functions, or rather, the sheaf of functions \mathcal{O} :

on each open set $U \subseteq X$ get a ring of functions $\mathcal{O}(U)$.

Example above: $\mathcal{O}(X) = k[x] / (x^2)$ ← we do not reduce the ring of functions

At what cost? Values of functions need not determine the abstract function:

$$\mathcal{O}(X) \ni \alpha + \beta x \longmapsto (\alpha + \beta x : X = \{0\} \rightarrow \mathbb{A}^1) \in \text{Hom}(X, \mathbb{A}^1)$$

$0 \longmapsto \alpha$ do not recover β .

Idea: the abstract " β " remembers that X arose from the collision of

two points, so β records tangential information: $\frac{\partial}{\partial x} (\alpha + \beta x) = \beta$.

0.3 What is a point?

← (and irreducible if not)

X topological space is reducible if $X = X_1 \cup X_2$ for proper closed $X_i \subseteq X$.

Euclidean world (more generally if X Hausdorff): $Y \subseteq X$ irreducible $\Leftrightarrow Y = \text{point}$ or $Y = \emptyset$

Classical Alg. Geom. $\left\{ \begin{array}{l} \text{point } a \in X \leftrightarrow \text{max ideal } m_a \subseteq k[X] \end{array} \right.$

closed $\emptyset \neq Y \subseteq X$ irreducible $\Leftrightarrow \mathbb{I}(Y) \subseteq k[X]$ prime ideal

R ring \Rightarrow "points" of R are $\text{Spec}(R) = \{\text{prime ideals of } R\}$ not just max ideals

Categorically a good choice since functorial:

$$\varphi: R \rightarrow S \text{ hom of rings} \Rightarrow \varphi^{-1}(\text{prime ideal}) = \text{a prime ideal}$$

$$\Rightarrow \text{Spec } S \xrightarrow{\varphi^{-1}} \text{Spec } R$$

← fails for max ideals
e.g. $\mathbb{Z} \xrightarrow{\varphi} \mathbb{Q}, \varphi^{-1}(0) = 0$
We were just lucky that
homs $k[Y] \rightarrow k[X]$ send
max ideal \rightarrow max ideal.

1. DEFINITION OF SCHEMES

1.1 Examples of affine schemes

Motivation: M $n \times n$ matrix over \mathbb{C}
 Then $\mathbb{C}[x] \rightarrow \mathbb{C}[M]$, $x \mapsto M$ has $\text{Ker} = \langle m_A \rangle$
 so $\mathbb{C}[M] \cong \mathbb{C}[x] / \langle m_A \rangle \cong \bigoplus \mathbb{C}[x] / (x-\lambda)^{n_i}$
 $\text{Spec } \mathbb{C}[M] = \{(x-\lambda) : \lambda: \text{eigenvalues of } A\}$

Spec(R) some ring R (always: comm. ring with 1)

- As a set: $\text{Spec}(R) = \{\text{prime ideals } p \subseteq R\} \leftarrow \text{(prime) Spectrum}$
- Zariski topology:
 \rightarrow e.g. $V(R) = \emptyset$
 $V(0) = \text{Spec } R$

closed sets: $V(I) = \{\text{prime ideals containing } I\} \subseteq \text{Spec } R$

- sheaf $\mathcal{O}_{\text{Spec } R}$ which we construct later. \leftarrow spaces of functions

Rmk The global functions are: $\mathcal{O}_{\text{Spec } R}(\text{Spec } R) = R$. \leftarrow so spaces of fns can recover the top. space!

Key exercise
 $(\Rightarrow$ axioms for a topology)

$$V(I) \cup V(J) = V(I \cdot J) = V(I \cap J)$$

$$\bigcap V(I_i) = V(\sum I_i)$$

Rmk
 $(I \cap J) \cdot (I \cap J) \subseteq I \cdot J \subseteq I \cap J$
 so $\sqrt{I \cdot J} = \sqrt{I \cap J}$
 but $I \cdot J$ and $I \cap J$ may be \neq

Key $V(I) = \emptyset \Leftrightarrow I = R \Leftrightarrow 1 \in I$, since any proper ideal \subseteq some max ideal

Topological consequences:

open sets: $U_I = \text{Spec } R \setminus V(I) = \bigcup_{f \in I} D_f$

basis of open sets: $D_f = \{p \in \text{Spec } R : f \notin p\}$
 $f \in R \rightarrow \{p \in \text{Spec } R : f(p) \neq 0\}$

Rmk $D_{f^n} = D_f$
 for $N \geq 1$,
 since $f^N \in p \Leftrightarrow f \in p$

"value of $f \in R$ at p ":
 $R \rightarrow R/p \hookrightarrow K(p) = \text{Frac}(R/p) \cong R_p / p \cdot R_p$
 $f \mapsto f(p)$

localisation of R at p
 \leftarrow target field depends on p !

Rmk:
 p prime
 \updownarrow
 R/p is integral domain

Remark $f(p) = 0 \Leftrightarrow f \in p$

Examples 1) $R = k[X] \leftarrow$ affine variety $X \subseteq \mathbb{A}^n$

$\text{Spec } R \xrightarrow[\text{II}]{\text{bijection}} \{\text{irreducible subvarieties } Y \subseteq X\}$
 $\cup \text{I} \quad \cup \text{I}$
 $\text{Specm } R \longleftrightarrow X \leftarrow$ and Zariski topologies agree
 $= \{\text{max ideals}\}$

Value of $f \in R$ at m_a : $m_a \rightarrow R/m_a \cong k$
 $(m_a = \langle x_1 - a_1, \dots, x_n - a_n \rangle) \quad f \mapsto f(a)$
 \leftarrow in this case the target field does not depend on the point

2) $\text{Spec } \mathbb{Z} = \{0\} \cup \{(p) : p \in \mathbb{N} \text{ prime}\}$

value of $f \in \mathbb{Z}$ at (0) :
 $\mathbb{Z} \rightarrow \text{Frac}(\mathbb{Z}/0) = \mathbb{Q}$
 $f \mapsto f$
 so lost no information.

$V((0)) = \{\text{prime ideals containing } (0)\} = \text{Spec } \mathbb{Z}$ so the point (0) is dense!
 $V((p)) = \{(p)\}$ are "closed points". Value of $f \in \mathbb{Z}$: $f((p)) = (f \in \mathbb{Z}/p) = (f \text{ mod } p)$

In general Prime ideals p with $V(p) = \text{Spec } R$ are called generic points
 prime ideals p with $V(p) = \{p\}$ are called closed points

Exercise $\{\text{closed points}\} = \{\text{max ideals of } R\}$

Exercises • a prime ideal \Rightarrow a radical ($a = \sqrt{a}$)
 • For a, b radical, $a \subseteq b \Leftrightarrow V(a) \supseteq V(b)$ ← order reversing!
 ← Hint consider R/b

Cor $V(I) \subseteq V(J) \Leftrightarrow \sqrt{I} \supseteq \sqrt{J}$
Pf $V(I) = V(\sqrt{I})$, so: $\Leftrightarrow V(\sqrt{I}) \subseteq V(\sqrt{J}) \Leftrightarrow \sqrt{I} \supseteq \sqrt{J}$ by exercise. \square

Cor $V(a) = V(b) \Leftrightarrow \sqrt{a} = \sqrt{b}$

recall radical of a
 $\sqrt{a} = \{f \in R : f^N \in a \text{ for some } N\}$
 $= \bigcap_{p \in V(a)} p$
 $\sqrt{a} \supseteq N: \text{radical}(R)$
 \parallel
 $\{\text{nilpotent elements of } R\}$
 \parallel
 $\bigcap_{p \in \text{Spec } R} p$

\Rightarrow $\{\text{closed sets of } \text{Spec } R\} \xleftrightarrow{1:1} \{\text{radical ideals of } R\}$ order-reversing correspondence

Proposition $f \in R$ vanishes at all $p \in \text{Spec } R \Leftrightarrow f$ nilpotent ← immediate from

Covering Trick $\text{Spec } R = \bigcup D_{f_i} \Leftrightarrow 1 \in \langle \text{all } f_i \rangle \Leftrightarrow \langle \text{all } f_i \rangle = R$

Pf $\text{Spec } R \setminus \bigcup D_{f_i} = \bigcap V(f_i) = V(\langle \text{all } f_i \rangle)$, now use previous Key. \square

Theorem $\text{Spec } R$ is quasi-compact ← (quasi-compact = compact = open covers have finite subcovers)

Pf $\text{Spec } R = \bigcup_i U_i$. As $U_i = \bigcup_j D_{f_{ij}}$, WLOG $U_i = D_{f_i}$.

Trick $\Rightarrow 1 = \sum_{\text{finite}} r_i f_i$ ← so finitely many f_i generate R , so those D_{f_i} cover. \square

Basic Exercises

1) $\varphi: R \rightarrow S$ ring hom $\Rightarrow \alpha: \text{Spec } S \rightarrow \text{Spec } R$, $p \mapsto \varphi^{-1}(p)$ is continuous
 indeed $\alpha^{-1}(D_f) = D_{\varphi f}$ ← (Hint: $f \notin p \subseteq R \Rightarrow \varphi f \notin \varphi p = q$ has $\varphi f \notin q$)

2) Show that $\text{Spec}(R/I)$ "is" the subspace $V(I) \subseteq \text{Spec } R$ and the quotient map $\pi: R \rightarrow R/I$ induces via (1) the inclusion map on Specs.

Here "is" means: can be canonically identified with

Example $\text{Spec}(R/(f)) = \{\text{prime ideals of } R \text{ containing } f\}$
 $= \text{the points of } \text{Spec } R \text{ where } f \text{ vanishes}$
 $= V(f)$

3) Show that $\text{Spec}(S^{-1}R)$ "is" a subspace of $\text{Spec } R$, where $S^{-1}R$ is localisation of R at a multiplicative set $S \subseteq R$, and $R \rightarrow S^{-1}R$, $r \mapsto \frac{r}{1}$ induces via (1) the inclusion

means: $1 \in S$
 $S \cdot S \subseteq S$
 (we do not require $0 \notin S$)

Example $S = \{1, f, f^2, f^3, \dots\}$, so $S^{-1}R = R_f$, then:

$\text{Spec } R_f = \{\text{prime ideals of } R \text{ not containing } f\}$
 $= \text{the points of } \text{Spec } R \text{ where } f \text{ does not vanish}$
 $= D_f$

4) $D_f \cap D_g = D_{fg}$, so $\text{Spec } R_f \cap \text{Spec } R_g = \text{Spec } R_{fg}$ ← (idea: $f^N = rg \Rightarrow \frac{1}{g} = \frac{r}{f^N}$)

5) $D_f \subseteq D_g \Leftrightarrow V(f) \supseteq V(g) \Leftrightarrow \sqrt{f} \subseteq \sqrt{g} \Leftrightarrow f^N \in (g) \text{ some } N \Leftrightarrow g \in R_f \text{ invertible}$

6) $p \subseteq R$ prime ideal $\Rightarrow R_p = S^{-1}R$ for $S = R \setminus p$, then $\exists!$ closed point $m_p = p \cdot R_p \in \text{Spec } R_p$
 so local ring: $\exists!$ max ideal m (\Leftrightarrow elts outside m are invertible)

Also: $m_p \in U \subseteq \text{Spec } R_p \text{ open} \Rightarrow U = \text{Spec } R_p$.

1.2 Definition of a scheme

RED: WORDS TO BE DEFINED LATER

Def A ringed space is

- a topological space X
- with a sheaf of rings \mathcal{O}_X on X

Locally ringed space if also:

- all stalks $\mathcal{O}_{X,x}$ are local rings
- (so \exists unique maximal ideal $\mathfrak{m}_{X,x} \subseteq \mathcal{O}_{X,x}$
and \exists residue field at x : $k(x) = \mathcal{O}_{X,x} / \mathfrak{m}_{X,x}$)

IDEA

- ← the points
- ← the functions
- ← the germs of functions near point x
- ← the "value" of a function at x lives here

Def An affine scheme is a locally ringed space isomorphic to $(\text{Spec } R, \mathcal{O}_{\text{Spec } R})$ for some ring R .

Def A scheme is a locally ringed space which is locally isomorphic to an affine scheme.

means:

$\forall x \in X \exists$ some open neighbourhood $x \in U \subseteq X$ s.t. $(U, \mathcal{O}_X|_U) \cong (\text{Spec } R, \mathcal{O}_{\text{Spec } R})$
 \exists some ring R depending on x

1.3 Pre-sheaves

Ab = category of abelian groups and group homs

X = any topological space

$\text{Top } X$ = category with objects: open sets $U \subseteq X$
 morphs: inclusion maps

if use category \mathcal{C}
 get (pre)sheaves with values in \mathcal{C}
 e.g. $\mathcal{C} = \text{Rings}$
 get presheaf of rings

$\leftarrow (\text{Mor}(U, V) = \begin{cases} \emptyset & \text{if } U \not\subseteq V \\ \{ \text{incl} \} & \text{if } U \subseteq V \end{cases}$

Def A presheaf (of abelian groups) on X is a contravariant functor
 $F : \text{Top } X \longrightarrow \text{Ab}$

So: \forall open $U \subseteq X$ have an abelian group $F(U)$ ← elements called sections (over U)

• \forall inclusion $U \rightarrow V$ have a "restriction" group hom

$$\boxed{F(V) \rightarrow F(U)} \\ s \longmapsto s|_U$$

• $F(\text{id}: U \rightarrow U) : F(U) \xrightarrow{\text{id}} F(U)$ so $s|_U = s$ for $s \in F(U)$.

• $U \subseteq V \subseteq W \Rightarrow F(W) \rightarrow F(V) \rightarrow F(U)$ so: $(s|_V)|_U = s|_U$ for $s \in F(W)$.

Example X topological space, $F(U) = \{ \text{continuous functions } U \rightarrow \mathbb{R} \}$ with obvious restrictions

Morphism of pre-sheaves = natural transformation of such functors: $\varphi : F \rightarrow G$

So: \forall open $U \subseteq X$ have $\varphi_U : F(U) \rightarrow G(U)$ group hom

\forall inclusion $U \rightarrow V$ have

$$\begin{array}{ccc} F(U) & \xrightarrow{\varphi_U} & G(U) \\ \uparrow & & \uparrow \\ F(V) & \xrightarrow{\varphi_V} & G(V) \end{array} \leftarrow \text{restriction homs}$$

so the homs "are compatible with restrictions"

i.e. this diagram with $\varphi_U = \text{inclusion}$

Sub pre-sheaf $F \subseteq G$ means $F(U) \subseteq G(U)$ subgp, compatibly with restrictions

1.4 Sheaves

Def Pre-sheaf F is a sheaf on X if it satisfies the local-to-global condition:

If U_i open, $s_i \in F(U_i)$ agreeing on overlaps:

$$s_i|_{U_i \cap U_j} = s_j|_{U_i \cap U_j} \in F(U_i \cap U_j)$$

idea: can uniquely extend!

Then \exists unique $s \in F(\cup U_i)$ with $s|_{U_i} = s_i$.

Consequences

- two sections $s, t \in F(U)$ equal \Leftrightarrow they equal locally: $s|_{U_i} = t|_{U_i}$, $U = \cup U_i$
- you can build sections by defining local sections, compatibly on overlaps.
- exact sequence: $0 \rightarrow F(U) \rightarrow \prod_i F(U_i) \rightarrow \prod_{i,j} F(U_i \cap U_j)$
(for $U = \cup U_i$)
 $s \mapsto (s_i)$ $(s_i) \mapsto (s_i|_{U_i \cap U_j} - s_j|_{U_i \cap U_j})$
- $F(\emptyset) = 0$ (Hint. consider empty covering of \emptyset)

Examples

1) Sheaf of continuous real functions: $F(U) = \{\text{continuous maps } U \rightarrow \mathbb{R}\}$

2) Skyscraper sheaf at p for group R : $F(U) = \begin{cases} 0 & \text{if } p \notin U \\ R & \text{if } p \in U \end{cases}$

3) Presheaf of constant functions for group R :

$$F(U) = \begin{cases} R & \text{if } U \neq \emptyset \\ 0 & \text{if } U = \emptyset \end{cases}$$

4) Sheaf of locally constant functions for group R : (\leftarrow i.e. constant on connected components)

$$F(U) = \prod_{i \in I_U} R \quad \text{where } I_U = \{\text{connected components of } U\}$$

Exercise (3) is not a sheaf if $X = 2$ points with discrete topology, $R \neq 0$.

Write $\text{Ab}(X) = \text{category of sheaves on } X$ and morphs of sheaves

$\text{Sh}(X)$ if work with category of Sets instead of Ab (morphs of presheaves)

1.5 Stalks

Def stalk at x of presheaf F is the abelian group

$$F_x = \lim_{x \in U} F(U)$$

\leftarrow direct limit over restriction maps induced by inclusions.

Explicitly:

An element of F_x is determined by $s \in F(U)$ some $U \ni x$ open, identify $s \sim t$ for $t \in F(V) \Leftrightarrow s|_W = t|_W$ some $U \cap V \supseteq W \ni x$ open

Rmk • natural map $F(U) \rightarrow F_x$, $s \mapsto s_x = \text{equivalence class of } s$. (for $x \in U$)
or write: $s|_x$

• morph $\varphi: F \rightarrow G$ then get $\varphi_x: F_x \rightarrow G_x$ ($\varphi_x(s_x) = \varphi_u(s)|_x$ if $s \in F(U)$)
or write: $\varphi|_x$

Exercise $\varphi, \psi: F \rightarrow G$ morphs of sheaves,
if all $\varphi_x = \psi_x: F_x \rightarrow G_x$ then $\varphi = \psi$.

Hint.
 $\varphi_u(s)|_W = \psi_u(s)|_W$
 $\parallel \parallel$
 $\varphi_w(s|_W) = \psi_w(s|_W)$
 Then use local-to-global

Facts For sheaves F, G in category $Ab(X)$

$F \rightarrow G$ monomorphism $\iff F_x \rightarrow G_x$ injective $\forall x$
 $F \rightarrow G$ epimorphism $\iff F_x \rightarrow G_x$ surjective $\forall x$
 $F \rightarrow G$ isomorphism $\iff F_x \rightarrow G_x$ iso $\forall x$

recall from category theory
 mono:
 $H \rightrightarrows F \rightarrow G \} \implies H \rightrightarrows F$
 composites equal } $\implies H \rightrightarrows F$ equal
 epi:
 $F \rightarrow G \rightrightarrows H \} \implies F \rightarrow G$
 composites equal } $\implies F \rightarrow G$ equal

Warning mono $\iff F(U) \rightarrow G(U)$ inj. $\forall U$, but fails for epi: $F(U) \rightarrow G(U)$ need not be surj.

1.6 Sheafification

F pre-sheaf $\implies F^+$ sheaf (ification):

so $\forall x \in U, \exists V \ni x, t \in F(V)$
 $s(y) = t_y \in F_y \forall y \in V$

$$F^+(U) = \{s: U \rightarrow \coprod F_x : \text{locally } s \text{ is a section of } F\}$$

comes with natural morph $F \rightarrow F^+ \leftarrow (s \in F(U) \mapsto (x \mapsto s_x) \in F^+(U))$

Exercise: F^+ is a sheaf, $F_x^+ = F_x$ and it satisfies:

Universal property \forall sheaf G on X ,
 $F^+ \xrightarrow{\exists!} G$
 \uparrow
 $F \xrightarrow{\psi} G$

(determines F^+ uniquely up to unique isomorph)

Hint. In our construction:

$$F_x^+ = F_x \longrightarrow G_x$$

so we know locally how sections map but we need to globalise...

$$\begin{array}{ccc} F & \longrightarrow & F^+ \\ \downarrow & & \downarrow \\ G & \longrightarrow & G^+ \end{array}$$

finally G is sheaf so $G = G^+$

(natural iso, using $G_x = G_x^+$ and Facts)

Example (pre-sheaf of constant functions) $^+ =$ (sheaf of locally constant functions)

Exercise 1) $F \subseteq G$ sub pre-sheaf, G sheaf $\implies \exists$ smallest subsheaf $H \subseteq G$ s.t. $F \subseteq H$
 Moreover, $H_x = F_x$.

("sheaf of discontinuous sections")

Hint mimic definition of F^+

2) $(DF)(U) = \prod_{x \in U} F_x$ with obvious restriction maps is a sheaf

3) $i: F \rightarrow DF$ obvious morph, let $F^b =$ presheaf image so $F^b(U) = i(U)$
 then $F^b \subseteq DF$ is a sub pre-sheaf and construction (1) gives $H = F^+$.

1.7 Kernels, Cokernels

$\varphi: F \rightarrow G$ morph of sh.

• $(\text{Ker } \varphi)(U) = \text{Ker } \varphi_U$ is sheaf

• $\text{Coker } \varphi = (\text{pre-Coker } \varphi)^+$ where $(\text{pre-Coker})(U) = \text{Coker } \varphi_U$

• $\text{Im } \varphi = (\text{pre-Im } \varphi)^+$ where $(\text{pre-Im})(U) = \text{Im } \varphi_U$

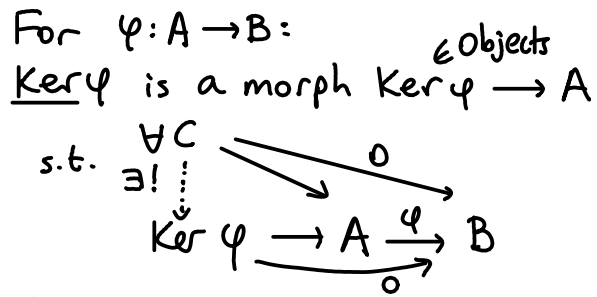

Fact $Ab(X)$ is an abelian category
 idea it "behaves like" category of abelian gps

Rmk In additive cat,
 mono $\Leftrightarrow H \xrightarrow{f} G \xrightarrow{g} H$ then $H \xrightarrow{0} F$
 epi $\Leftrightarrow F \xrightarrow{f} G \xrightarrow{g} H$ then $G \xrightarrow{0} H$
 categorical Ker & Coker, see below

Def abelian category = additive category such that morphisms have Ker, Coker
 and i) $\varphi: F \rightarrow G$ monomorph is the Ker of its Coker
 ii) " " epimorph " Coker " Ker

Def additive category means $Mor(A, B)$ abelian gp (so often write $Hom(A, B)$) s.t.
 • Composition of morphisms distributes over addition
 • \exists products $A \times B$ ($\forall Obj. X, (\exists! morph 0 \rightarrow X) (\exists! morph X \rightarrow 0)$)
 • \exists zero object 0 (an object that is both initial & terminal)

Functor F of additive/abelian cats is additive if $Hom(A, B) \rightarrow Hom(FA, FB)$ is gp. hom.

$Im \varphi = Ker(Coker \varphi)$
 which is a morph $Im \varphi \rightarrow B$
Facts $\exists!$ factorization of φ
 $A \rightarrow Im \varphi \rightarrow B$
 Abelian cat $\Rightarrow A \rightarrow Im \varphi$ epi
 and $= Coker(Ker \varphi)$

Fact $Ker \varphi$ is a monomorph.

Fact $Coker \varphi$ is an epimorph.
 If φ mono, define the quotient $B/A := Coker \varphi$

Example For abelian gps, (ii) says:
 $A \xrightarrow{\varphi} B \xrightarrow{\pi} B/A$ as expected!
 $Ker \pi = Ker \varphi$ is $Ker \pi$
 B/A is $Coker \varphi = Coker Ker \pi$
Freyd-Mitchell Thm

Rmk These categorical definitions can be cumbersome to work with. It turns out:
 \forall small abelian category \mathcal{A} , \exists a possibly non-commutative ring R with 1
 and full faithful exact functor $\mathcal{A} \rightarrow \{left R\text{-modules}\}$ (in particular preserves
 (Obj(\mathcal{A}) and Homs are sets not just "class")) \Rightarrow can "pretend" you work with modules. (Ker, Coker, and is additive)
 (example you just apply the theorem to the small abelian subcategory involved in your diagram/sequence of maps - don't need to use the whole category)

1.8 Exactness

A (cochain) complex $F^\bullet = (\dots \rightarrow F^{i-1} \xrightarrow{d^{i-1}} F^i \xrightarrow{d^i} F^{i+1} \rightarrow \dots)$ in an abelian cat
 means composite of two consecutive morphs is zero: $d^{i+1} \circ d^i = 0$.

(Co)homology $H^i(F^\bullet) = Ker d^{i+1} / Im d^i$ (\exists mono $Im d^i \hookrightarrow Ker d^{i+1}$ and H^i is its coker)

F^\bullet exact means $Im d^i = Ker d^{i+1}$ (\Leftrightarrow complex with zero homology $H^i = 0$)

Proposition complex F^\bullet in $Ab(X)$ exact $\Leftrightarrow F_x^\bullet$ is exact sequence of abelian gps $\forall x \in X$
 (Immediate by **Facts** on previous page)

Rmk For SES (short exact sequences) $0 \rightarrow F \xrightarrow{\alpha} G \xrightarrow{\beta} H \rightarrow 0$ of sheaves
 you usually check exactness at level of stalks, but can equivalently check:

- i) $0 \rightarrow F(U) \rightarrow G(U) \rightarrow H(U)$ exact \forall open U
- ii) H is smallest subsheaf containing pre- $Im \beta$, meaning every section of H can be obtained by gluing local sections of type $\beta(\text{local section})$

A functor of abelian cats is left exact if: $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ exact $\Rightarrow 0 \rightarrow FA \rightarrow FB \rightarrow FC$ exact
right exact if $\Rightarrow FA \rightarrow FB \rightarrow FC \rightarrow 0$ exact

$(F \text{ exact} \Leftrightarrow F \text{ both left \& right exact})$

Example $\text{Hom}_R(M, \cdot)$ is left exact, $\cdot \otimes_R M$ is right exact, as functors on R -mods (any R -mod M)

1.9 Push-forward (direct image) and inverse image

$f: X \rightarrow Y$ continuous

\Rightarrow additive functor $f_*: \text{Ab} X \rightarrow \text{Ab} Y$

Def $F \in \text{Ab}(X)$ gives $f_* F \in \text{Ab}(Y)$:

$$(f_* F)(V) = F(f^{-1}(V))$$

Exercise $(g \circ f)_* F = g_*(f_* F)$ for $X \xrightarrow{f} Y \xrightarrow{g} Z$.

\Rightarrow additive functor $f^{-1}: \text{Ab} Y \rightarrow \text{Ab} X$

Def $F \in \text{Ab}(Y)$ gives $f^{-1} F \in \text{Ab}(X)$ is $(\text{pre-}f^{-1} F)^+$ where

$$(\text{pre-}f^{-1} F)(U) = \varinjlim_{V \supseteq f(U)} F(V)$$

PICTURE IN MIND

PICTURE IN MIND

also follows by uniqueness up to unique iso of adjoint functors, see next page.

Exercise $(f^{-1} F)_x = F_{f(x)}$ and $(g \circ f)^{-1} \cong_{\text{canonical}} f^{-1} \circ g^{-1}$

Examples 1) $i: S \rightarrow X$ inclusion of an open subset :

$$F \in \text{Ab}(S) \quad i_* F: V \mapsto F(V \cap S)$$

$$F \in \text{Ab}(X) \quad i^{-1} F: U \mapsto F(U) \leftarrow \text{denoted } F|_S \text{ called restriction of } F$$

$\text{open } S \subseteq X$

2) $i_x: \text{point} \rightarrow X, i_x(\text{point}) = x$

$$F \in \text{Ab}(X) \quad i_x^{-1} F = F_x$$

\leftarrow (more precisely $(i_x^{-1} F)(U) = \begin{cases} F_x & \text{if } U = \{\text{point}\} \\ 0 & \text{if } U = \emptyset \end{cases}$ will not make such remarks again.)

3) $\pi: X \rightarrow \text{point}$

$$F \in \text{Ab}(X) \quad \pi_* F = \Gamma(X, F) = F(X) \leftarrow \text{global sections functor}$$

Proposition 1) f_* is left exact

2) f^{-1} is exact

\leftarrow in particular $\Gamma(X, \cdot)$ is left exact

For f_* : exercise

proof for f^{-1} : $0 \rightarrow (f^{-1} A)_x \rightarrow (f^{-1} B)_x \rightarrow (f^{-1} C)_x \rightarrow 0$
 $0 \rightarrow A_{f(x)} \rightarrow B_{f(x)} \rightarrow C_{f(x)} \rightarrow 0$ which by assumption is exact \square

Rmk f_* left exact } would follow by category theory from next proposition
 f^{-1} right exact }

Proposition f^{-1} is the left adjoint functor of f_* , meaning \exists natural iso

$$\text{Mor}(f^{-1}F, G) \cong \text{Mor}(F, f_*G) \text{ which is natural in } F \text{ and } G$$

Sketch pf

In \rightarrow direction:

$$F(V) \xrightarrow{\text{since } W=V \text{ is allowed}} \lim_{W \supseteq fU} F(W) \xrightarrow{\text{given}} G(U)$$

|| \leftarrow pick $U = f^{-1}V$
 $G(f^{-1}V) = f_*G(V)$

Rmk to get a map into a direct limit, you just need a representative element in one of the groups

In \leftarrow direction:

$$F(V) \xrightarrow{\text{given}} G(f^{-1}V)$$

\leftarrow assume $V \supseteq fU$
take \lim over such V

$$\lim_{V \supseteq fU} F(V) \longrightarrow \lim_{V \supseteq fU} G(f^{-1}V) \xrightarrow{\text{restriction}} G(U)$$

\leftarrow notice $f^{-1}V \supseteq U$

Rmk to get map out of a direct limit, need maps out of all groups, compatibly with maps of lim

Now check these two are natural transformations, inverse to each other, and natural in F, G . \square

Rmk Another example of adjoint functors, for R -modules, are $\text{Hom}(M, \cdot)$ and $\otimes M$:
 $\text{Hom}(F \otimes M, G) \cong \text{Hom}(F, \text{Hom}(M, G))$ for R -mods F, G .

1.10 Morphisms of ringed spaces

Def $(f, \varphi): (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ morph of ringed spaces means

$X \xrightarrow{f} Y$ continuous map of topological spaces

$f_*\mathcal{O}_X \xleftarrow{\varphi} \mathcal{O}_Y$ morph of sheaves of rings (on Y)

often write $\varphi = f^\#$

work with $\text{Ring}(X)$ instead of $\text{Ab}(X)$, so rings & ring homs instead of ab. gps. & gp. hom

(So: $\mathcal{O}_X(f^{-1}V) \xleftarrow[\text{ring hom}]{\varphi_V} \mathcal{O}_Y(V)$ for $V \subseteq Y$, compatibly with restrictns.)

For a morphism of locally ringed spaces want in addition:

$\mathcal{O}_{X,x} \xleftarrow{\varphi_x} \mathcal{O}_{Y,fx}$ is local ring hom

$\varphi: R \rightarrow S$ local rings is local ring hom if $\varphi(m_R) \subseteq m_S$.
 Equivalently: $\varphi^{-1}(m_S) = m_R$
 since this \mathfrak{m} is prime and contains m_R

(Explanation: $\varphi_V(\frac{s}{\uparrow} \in \mathcal{O}_Y(V)) \in \mathcal{O}_X(f^{-1}V)$ is a representative for $\varphi_x(s_{fx})$)

(This ensures that germs of functions vanishing at fx map to germs vanishing at x)

Rmk Can compose: $(X, \mathcal{O}_X) \xrightarrow{f} (Y, \mathcal{O}_Y) \xrightarrow{g} (Z, \mathcal{O}_Z)$:

$$(g \circ f)_* \mathcal{O}_X = g_* f_* \mathcal{O}_X \xleftarrow{g_*(f^\#)} g_* \mathcal{O}_Y \xleftarrow{g^\#} \mathcal{O}_Z$$

g_* is a functor so $g_*(\varphi)$ means: apply g_* to $f_*\mathcal{O}_X \xleftarrow{f^\#} \mathcal{O}_Y$

Rmk Notice in the definition we cannot just talk about a morphism $\mathcal{O}_X \leftarrow \mathcal{O}_Y$ because the sheaves are not defined over the same topological space.

\Rightarrow either need a morph $f_*\mathcal{O}_X \leftarrow \mathcal{O}_Y$ of sheaves on Y
 or a morph $\mathcal{O}_X \leftarrow f^{-1}\mathcal{O}_Y$ of sheaves on X

By the proposition, this is the same information since $\text{Mor}(f^{-1}\mathcal{O}_Y, \mathcal{O}_X) \cong \text{Mor}(\mathcal{O}_Y, f_*\mathcal{O}_X)$

(Notice also the map on stalks $\mathcal{O}_{X,x} = (\mathcal{O}_X)_x \leftarrow (f^{-1}\mathcal{O}_Y)_x = \mathcal{O}_{Y,fx}$ is the φ_x above)

1.11 A sheaf defined on a topological basis

X top. space with a basis B of open subsets \leftarrow (means: basic sets cover X , and: \forall basic $B_1, B_2, x \in B_1 \cap B_2$ \exists basic B with $x \in B \subseteq B_1 \cap B_2$)

Def B-sheaf F means

$\cdot F(U) \in \text{Ab}, \forall$ basic U with homs $F(U) \rightarrow F(V), s \mapsto s|_V \quad \forall$ basic $V \subseteq U$
and as usual: $F(U) \xrightarrow{\text{id}} F(U)$ and $F(U) \rightarrow F(V) \rightarrow F(W)$ for $W \subseteq V \subseteq U$

\cdot local-to-global condition:

\forall basic U with $U = \cup U_i$ \leftarrow basic

$\forall s_i \in F(U_i)$ "agreeing locally on overlaps":

$\forall x \in U_i \cap U_j \exists$ basic $x \in U_k \subseteq U_i \cap U_j$ with

$$s_i|_{U_k} = s_j|_{U_k} \in F(U_k)$$

$\Rightarrow \exists$ unique $s \in F(U)$ with $s|_{U_i} = s_i$.

Rmk stalk $F_x = \varinjlim_{x \in \text{basic } V} F(V)$.

Theorem 1) B-sheaf F extends uniquely (up to unique iso) to a sheaf F on X . \leftarrow so $F(\text{basic } U)$ and stalks F_x are same up to canonical iso.

2) B-sheaves F, G then morph $F \rightarrow G$ on the extended sheaves is uniquely defined by data:

\cdot homs $F(U) \rightarrow G(U)$ for basic U , commuting with restrictions (for basic opens)

Proof (1):

Uniqueness

Given such an extension F , sections are uniquely determined by restriction to basic opens:

any U open $\Rightarrow s \in F(U)$ uniquely determined by $s|_V =: s_V \quad \forall (\text{basic } V) \subseteq U$
(since U can be covered by basic sets)

Conversely, given $s_V \in F(V)$ the usual local-to-global condition

$$s_V|_{V \cap V'} = s_{V'}|_{V \cap V'} \in F(V \cap V') \quad \forall (\text{basic } V, V') \subseteq U$$

is equivalent to \star above, by sheaf property for F .

Existence

$$F(U) = \varprojlim_{(\text{basic } V) \subseteq U} F(V)$$

\leftarrow inverse limit over restrictions for basics

\leftarrow "compatible families of local sections on basic open sets"

$$= \left\{ (s_V) \in \prod_{(\text{basic } V) \subseteq U} F(V) : s_V|_W = s_W \quad \forall W \subseteq V \subseteq U \right\}$$

with obvious restriction maps (for $U' \subseteq U$ a subset of the $(\text{basic } V) \subseteq U$ are $\subseteq U'$)

Notice: $F(\text{basic } U)$ has not changed up to canonical identification:

$$F(U) \xrightarrow{\cong} \varprojlim_{(\text{basic } V) \subseteq U} F(V)$$

$$s \longmapsto (s|_V) \quad \text{which includes } s|_U = s.$$

and for stalks:

$$\varinjlim_{x \in (\text{basic } V)} F(V) \xrightarrow{\cong} \varinjlim_{x \in U} F(U)$$

← easy check: if sections agree on $x \in W$ then agree on $x \in V \subseteq W$ some basic V .

← includes basic $U=V$

Proof (2): by functoriality of \varprojlim :

$$\varprojlim_{(\text{basic } V) \subseteq U} F(V) \longrightarrow \varprojlim_{(\text{basic } V) \subseteq U} G(V). \quad \square$$

Rmk Equivalently, it is enough to remember germs around each point:

$$F(U) = \left(\varprojlim_{(\text{basic } V) \subseteq U} F(V) \right) \xrightarrow{\cong} \left\{ s: U \rightarrow \prod_{x \in X} F_x : s(x) \in F_x \text{ which are "locally compatible":} \right.$$

↑ take germs

with obvious restriction maps for these (just restrict the map $U \rightarrow \prod F_x$).

$$\left. \begin{array}{l} \forall x \in U, \exists x \in (\text{basic } V) \subseteq U \\ \exists t \in F(V) \\ \exists \text{ open } x \in W \subseteq V \end{array} \right\} \text{with } t_y = s(y) \quad \forall y \in W$$

Rmk Can simplify • WLOG W also basic (just pick $x \in \text{basic } \subseteq W$) } so: $\forall x \in U \exists x \in (\text{basic } V) \subseteq U$
 • WLOG replace V by W , so $V=W$ basic. } $\exists t \in F(V)$ with $t_y = s(y) \quad \forall y \in V$

Inverse: have cover $U = \cup (\text{basic } x \in V^x)$ and $t^x \in F(V^x)$ s.t. t^x agree locally (since germs agree) } so \star holds so can extend to unique global section.

1.12 Construction of $\mathcal{O}_{\text{Spec } R}$

$X = \text{Spec } R$, we define \mathcal{O}_x first on basic open sets:

$$\mathcal{O}_x(D_f) = R \text{ localised at multiplicative set } \{g : g \text{ does not vanish on } D_f\}$$

$$\cong R_f$$

↑ natural

Motivation: $\frac{1}{g}$ should be an acceptable function on D_f provided we don't divide by zero!

(Recall exercise: $\begin{array}{l} \updownarrow \\ V(g) \subseteq V(f) \Leftrightarrow D_f \subseteq D_g \\ \Leftrightarrow f^N \in (g) \Leftrightarrow g \in R_f \text{ invertible} \end{array}$)

For $D_f \subseteq D_g$ define natural restriction homs: (which are compatible under composition)

$$\mathcal{O}_x(D_g) \longrightarrow \mathcal{O}_x(D_f)$$

$$\parallel \downarrow \quad \parallel \downarrow$$

$$R_g \longrightarrow R_f$$

← "localise further"

← explicitly: $f^N = rg$ so

$$\frac{x}{g^m} \longmapsto \frac{x r^m}{(rg)^m} = \frac{x r^m}{f^N m}$$

Lemma 1 This is a B-sheaf on X for $B = \{ \text{basic open sets } D_f, f \in R \}$

Pf Uniqueness: $\alpha, \beta \in R_f = \mathcal{O}_X(D_f)$ and $D_f = \cup D_{f_i}$

(in \star) if $\alpha|_{D_{f_i}} = \beta|_{D_{f_i}} \forall i$ then $\alpha = \beta$

↑

Proof By redefining X, R by D_f, R_f we can assume $f=1, R_f=R, D_f=X$.

$\alpha - \beta = 0 \in R_{f_i} \Rightarrow f_i^N \cdot (\alpha - \beta) = 0$ some $N \in \mathbb{N} \leftarrow N$ may depend on i , but

$\Rightarrow \langle \text{all } f_i^N \rangle \cdot (\alpha - \beta) = 0$ (quasi-compactness) \rightarrow WLOG finite subcover D_{f_i} so pick maximal N

recall "Covering Trick" $\rightarrow \cong R$ since $X = D_{f_1} \cup \dots \cup D_{f_n} = D_{f_1^N} \cup \dots \cup D_{f_n^N} \leftarrow$ (recall $D_f = D_{f^N}$)

$\Rightarrow 1 \cdot (\alpha - \beta) = 0$ so $\alpha = \beta \quad \square$

Existence in \star : as before WLOG $U = D_f, R_f$ become X, R .

Uniqueness \Rightarrow in \star can assume sections $s_i \in \mathcal{O}_X(D_{f_i})$ agree on overlaps $D_{f_i} \cap D_{f_j} = D_{f_i f_j}$

(apply Uniqueness to $D_{f_i f_j}$)

$$s_i|_{D_{f_i f_j}} = s_j|_{D_{f_i f_j}} \in R_{f_i f_j}$$

WLOG $X = D_{f_1} \cup \dots \cup D_{f_n}$ finite cover, $s_i = \frac{g_i}{f_i^{n_i}}$ since $D_{f_i} = D_{f_i^{n_i}}$, WLOG $n_i = 1$, so $s_i = \frac{g_i}{f_i}$

$s_i = s_j$ on $D_{f_i f_j} \Rightarrow (f_i f_j)^N (f_j g_i - f_i g_j) = 0 \in R \leftarrow N$ depends on i, j but can pick largest N over finitely many i, j so N works $\forall i, j$

rewrite: $\underbrace{(f_j^{N+1})}_{b_j} \cdot \underbrace{(f_i^N g_i)}_{a_i} - \underbrace{(f_i^{N+1})}_{b_i} \cdot \underbrace{(f_j^N g_j)}_{a_j} = 0$
 notice $s_i = \frac{a_i}{b_i}, D_{f_i} = D_{b_i}$ so WLOG $N=0!$ so $f_j g_i = f_i g_j$

"Covering Trick": $X = D_{f_1} \cup \dots \cup D_{f_n}$ so $1 = \sum r_i f_i \leftarrow$ ("partition of unity" trick)

$$1 \cdot g_j = \left(\sum_i r_i f_i \right) g_j = \sum_i r_i (f_i g_j) = \sum_i r_i (f_j g_i) = f_j \left(\sum_i r_i g_i \right)$$

$\Rightarrow s_j = \frac{g_j}{f_j} = \frac{\sum_i r_i g_i}{1} \in R_{f_j} \quad \forall j$ so we globalised the $s_j \in \mathcal{O}_X(D_{f_j})$ to $\sum_i r_i g_i \in \mathcal{O}_X(X) = R \quad \square$

Corollary \mathcal{O}_X extends uniquely to a sheaf on $X = \text{Spec } R$ called structure sheaf (or sheaf of regular functions)

stalk $\mathcal{O}_{X, p} := \lim_{D_f \ni p} \mathcal{O}_X(D_f)$

Messy unpacking of definitions: we identify $\frac{r}{f^m} \in R_f \cong \mathcal{O}_X(D_f)$ and $\frac{s}{g^n} \in R_g \cong \mathcal{O}_X(D_g)$ iff $\frac{r}{f^m} = \frac{s}{g^n} \in R_h$ some $h \in R$ with $p \in D_h \subseteq D_f \cap D_g$ (iff $h^N (r g^n - s f^m) = 0 \in R$ some N)

Lemma 2

$$\begin{array}{ccc} \mathcal{O}_{X, p} & \cong & R_p \\ \text{rest. } \uparrow & & \uparrow \text{localise} \\ \mathcal{O}_X(X) & \cong & R \end{array}$$

Pf $\lim_{D_f \ni p} \mathcal{O}_X(D_f) \cong \lim_{f \notin p} R_f \cong R_p \quad \square$

straightforward algebra exercise \leftarrow (Recall in R_p you invert all elements $f \notin p$)

$\Rightarrow \mathcal{O}_X(U) = \{s: U \rightarrow \bigsqcup_{p \in X} R_p : s(p) \in R_p \text{ which are locally compatible:}$

$\forall p \in U, \exists \text{ open nbhd } p \in D_f \subseteq U \text{ with } s(x) = t_x \}$
 $\exists t \in \mathcal{O}_X(D_f)$
 $\stackrel{f}{=} \frac{t}{f} \stackrel{f}{=} R_f$ some $f \in R$
 $\forall x \in D_f \parallel \frac{t}{f} \in \mathcal{O}_{X,x}$

with the obvious restriction maps.

Rmk could assume $t = \frac{f}{f}$ since can replace D_f with $D_{fm} (= D_f)$.
 • could just ask $s(x) = t_x$ on a smaller open $p \in V \subseteq D_f$.

is image via natural $\mathcal{O}_X(D_f) \rightarrow \mathcal{O}_{X,x}$

Comparison with classical algebraic geometry

recall
 $k = \text{alg. closed field}$
 $k[X] = k[x_1, \dots, x_n]$
 $\mathbb{I}(X)$

• X affine variety, $p \in U \subseteq X$ open nbhd

$f: U \rightarrow k$ is regular at p if \exists open nbhd $p \in W \subseteq U$ with

$$f = \frac{g}{h} \text{ on } W, \quad g, h \in k[X], \quad h(w) \neq 0 \quad \forall w \in W$$

Rmk In fact can assume $W = D_h$ basic open (if $f = \frac{g}{h}$, replace D_h by $D_{h^2} = D_h$)

$\mathcal{O}_X(U) = k$ -algebra of functions $U \rightarrow k$ regular at all $p \in U$

$\mathcal{O}_{X,p} = k$ -algebra of germs of functions near p , regular at p

(so pairs (U, f) with $p \in U \subseteq X$ open, $f: U \rightarrow k$ regular at p
 and identify $(U, f) \sim (V, g) \Leftrightarrow f|_W = g|_W$ on some open $p \in W \subseteq U \cap V$)

Theorem $\mathcal{O}_X(X) \cong k[X] \leftarrow$ (Rmk This theorem is not obvious in C3.4 course.
 $X = \text{Spec } k[X]$ so by Lemma 1 get $\mathcal{O}_X(X) = k[X]$)

• $X \subseteq \mathbb{A}^n$ affine variety

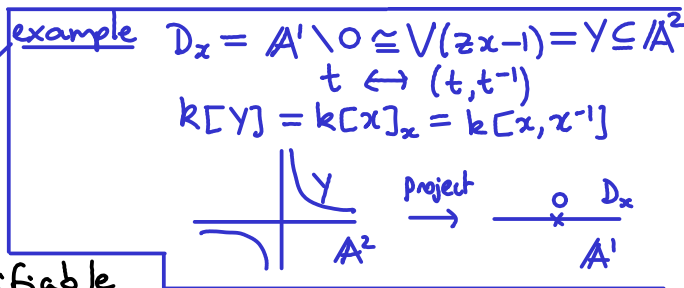

$f \in R = k[x_1, \dots, x_n]$ polynomial

$V(f) = \{f=0\} \subseteq X$ hypersurface

$D_f = \{f \neq 0\} \subseteq X$ open, but identifiable

with affine variety $Y = V(zf - 1) \subseteq \mathbb{A}^{n+1}$ ($D_f \rightarrow Y, a \mapsto (a, \frac{1}{a})$)

and $k[Y] = k[X] / (zf - 1) \cong k[X]_f$
 $z \leftrightarrow \frac{1}{f}$

fact $\mathcal{O}_X(D_f) \cong k[X]_f$

$\mathcal{O}_{X,p} \cong k[X]_{m_p}$

\leftarrow where $m_p = \mathbb{I}(p) = \{f \in k[X] : f(p) = 0\}$
 is max ideal corresponding to p .

local ring

$\mathcal{O}_{X,p} / m_{X,p} = m_p \cdot k[X]_{m_p} = \text{germs of functions near } p \text{ vanishing at } p$

residue field

$$K(p) = \mathcal{O}_{X,p} / m_{X,p} \cong k, \quad \frac{g}{h} \mapsto \frac{g(p)}{h(p)}$$

1.13 Morphisms between Specs

$$\varphi: R \rightarrow S \text{ hom of rings} \Rightarrow \boxed{\text{Spec}(\varphi): \text{Spec } S \rightarrow \text{Spec } R}$$

$$p \mapsto \varphi^{-1}(p)$$

Example $\varphi: R \rightarrow R_f, r \mapsto \frac{r}{1}$ localisation

$\text{Spec } R \leftarrow \text{Spec } R_f$ is an inclusion with image = D_f .

$$\alpha = \text{Spec}(\varphi): Y \rightarrow X, p \mapsto \varphi^{-1}(p)$$

Lemma $\alpha^{-1}(D_f) = D_{\varphi(f)}$

automatically true!

Pf $\alpha^{-1}\{q \in X: f \notin q\} = \{p \in Y: \varphi^{-1}(p) = q \text{ some } q \in X, f \notin \varphi^{-1}(p)\}$
 $= \{p \in Y: \varphi(f) \notin p\}. \square$

Claim $\exists \varphi^\#: \mathcal{O}_X \rightarrow \alpha_* \mathcal{O}_Y$ such that $\varphi^\#_X: \mathcal{O}_X(X) = R \xrightarrow{\varphi} S = \alpha_* \mathcal{O}_Y(X)$

Pf Enough to build $\varphi^\#$ on basic opens, compatibly with restrictions

(By Theorem on B-sheaves)

$$\begin{array}{ccc} \varphi^\#: \mathcal{O}_X(D_f) & \rightarrow & \alpha_* \mathcal{O}_Y(D_f) = \mathcal{O}_Y(\alpha^{-1}D_f) = \mathcal{O}_Y(D_{\varphi(f)}) \\ \parallel & \xrightarrow{\text{natural hom}} & \parallel \\ R_f & & S_{\varphi(f)} \\ \frac{r}{f^n} \mapsto & & \frac{\varphi(r)}{\varphi(f^n)} = \frac{\varphi(r)}{\varphi(f)^n} \end{array}$$

Easy check: compatible with restriction maps for $D_g \subseteq D_f. \square$

Claim $\mathcal{O}_{X,p}$ is local and $\varphi^\#$ is local

Pf Lemma 2: $\mathcal{O}_{X,p} \cong R_p$ so local with max ideal $\mathfrak{m}_p = p \cdot R_p$.

For $p \in Y, \varphi^\#_p: \mathcal{O}_{X, \varphi^{-1}p} \rightarrow \mathcal{O}_{Y,p}$

$$\begin{array}{ccc} \mathcal{O}_{X, \varphi^{-1}p} & \rightarrow & \mathcal{O}_{Y,p} \\ \parallel & & \parallel \\ R_{\varphi^{-1}p} & \rightarrow & S_p \end{array}$$

is direct limit of maps hence:
 natural map: $\frac{r}{t} \mapsto \frac{\varphi(r)}{\varphi(t)}$
 $t \notin \varphi^{-1}p$ so $\varphi(t) \notin p$

\Rightarrow Theorem (ring R) \rightarrow locally ringed space $(\text{Spec } R, \mathcal{O}_{\text{Spec } R})$
 (ring hom $R \xrightarrow{\varphi} S$) $\rightarrow ((\text{Spec } \varphi, \varphi^\#): (\text{Spec } S, \mathcal{O}_{\text{Spec } S}) \rightarrow (\text{Spec } R, \mathcal{O}_{\text{Spec } R}))$

Contravariant functor $\boxed{\text{Spec}: \text{Rings} \rightarrow \text{Locally Ringed Spaces}}$ (easy to check)

Claim The functor is fully faithful \leftarrow i.e. surj & inj. (so iso) on morphism spaces

Pf Given a hom of loc. ringed spaces $(f, f^\#): (Y, \mathcal{O}_Y) \rightarrow (X, \mathcal{O}_X)$ $X = \text{Spec } R, Y = \text{Spec } S$

Let $\varphi := f^\#_X: R \cong \mathcal{O}_X(X) \xrightarrow{f^\#_X} f_* \mathcal{O}_Y(X) = \mathcal{O}_Y(Y) \cong S$ ring hom.

$$\begin{array}{ccc} \downarrow l_{f_p} & & \downarrow l_p \\ R_{f_p} \cong \mathcal{O}_{X, f_p} & \xrightarrow{f^\#_p} & \mathcal{O}_{Y, p} \cong S_p \supseteq \mathfrak{m}_p = p \cdot S_p \end{array}$$

\leftarrow localisation maps (Lemma 2) for $\mathcal{O}_X, \mathcal{O}_Y$

$\Rightarrow \varphi^{-1}(p) = \varphi^{-1}(\underbrace{l_p^{-1}(\mathfrak{m}_p)}_p) = \underbrace{l_{f_p}^{-1}(f^\#_p^{-1}(\mathfrak{m}_p))}_{\mathfrak{m}_{f_p}} = f(p)$
 since $f^\#_p$ local ring hom

$\Rightarrow f(p) = \varphi^{-1}(p)$ so $f = \text{Spec}(\varphi)$ is the map on Specs induced by $\varphi: R \rightarrow S$.

Upshot: have two morphs of sheaves $f^\#, \varphi^\# : \mathcal{O}_X \rightarrow \text{Spec}(\varphi)_* \mathcal{O}_Y$

and $f^\# = \varphi^\#$ since equal on stalks (by the diagram have $f^\#_p = \varphi^\#_p$) \square

$$\begin{array}{ccc} R & \xrightarrow{f^\#} & \varphi(R) \\ \downarrow \varphi^\# & \longrightarrow & \downarrow \varphi^\# \\ S & \xrightarrow{\varphi^\#} & \varphi(S) \\ \downarrow \varphi^\# & \longrightarrow & \downarrow \varphi^\# \\ R & \xrightarrow{\varphi^\#} & \varphi(R) \\ \downarrow \varphi^\# & \longrightarrow & \downarrow \varphi^\# \\ S & \xrightarrow{\varphi^\#} & \varphi(S) \end{array}$$

Def Aff = category of affine schemes (and morphs of locally ringed spaces)

\hookrightarrow locally ringed spaces $\cong (\text{Spec } R, \mathcal{O}_{\text{Spec } R})$ some ring R

$\Rightarrow \text{Spec} : \text{Rings}^{\text{op}} \rightarrow \text{Aff}$ is an equivalence of categories.

(op = opposite category = reverse arrows so artificially make Spec covariant)

full, faithful, essentially surjective functor

each object in target category is iso to an object in image

1.14 Closed affine subschemes

$X = \text{Spec } R, I \subseteq R$ ideal

$Y = V(I) \cong \text{Spec}(R/I)$ are called closed (affine) subschemes of X

$(p \subseteq R \text{ prime } \supseteq I) \mapsto p \cdot R \subseteq R/I$

\hookrightarrow (as top. space, $V(I) = V(\sqrt{I})$ but sheaf remembers $I: \mathcal{O}_Y(Y) = R/I$)

Example $I = \mathfrak{m}$ max ideal \Rightarrow get a closed point $\{\mathfrak{m}\} = \text{Spec } R/\mathfrak{m} \hookrightarrow X$.

Rmk $\text{Spec}(R/J)$ is closed subscheme of $\text{Spec}(R/I)$ means $J \supseteq I$

Warning

$\Rightarrow V(J) \subseteq V(I)$

$\nRightarrow \sqrt{J} \supseteq \sqrt{I}$

Def $\text{Spec } R/I \cap \text{Spec } R/J := \text{Spec}(R/I+J), \text{Spec } R/I \cup \text{Spec } R/J := \text{Spec } R/I \cap J$

Define sheaf of ideals $\mathcal{J} = \mathcal{J}_{X/Y}$ on X :

(also: ideal sheaf) $\mathcal{J}(D_f) = I \cdot R_f \subseteq R_f = \mathcal{O}_X(D_f)$ ideal

Notice $\mathcal{O}_Y(D_f) = (R/I)_f \cong R_f/I \cdot R_f = \mathcal{O}_X(D_f)/\mathcal{J}(D_f)$

Classical Alg. Geom: $\mathcal{J}(U)$ are the regular functions vanishing on $Y \cap U$

Note $I \cdot R_f = \text{Ker}(R_f \rightarrow R_f/I \cdot R_f)$
 \parallel
 $\mathcal{J}(D_f) = \text{Ker}(\mathcal{O}_X(D_f) \rightarrow \mathcal{O}_X(D_f)/\mathcal{J}(D_f))$

$$\Rightarrow \begin{array}{l} \mathcal{J} = \text{Ker}(\mathcal{O}_X \rightarrow j_* \mathcal{O}_Y) \\ \mathcal{O}_Y = \mathcal{O}_X / \mathcal{J} \end{array}$$

\leftarrow where $j: Y \rightarrow X$ inclusion.
 \leftarrow more precisely this is $j_* \mathcal{O}_Y$

Def A sheaf of ideals on $X = \text{Spec } R$ is quasi-coherent if it arises as \mathcal{J} as above, some ideal $I \subseteq R$

Rmk Later will consider more generally sheaves of R -modules and quasi-coherence.

1.15 Closed subschemes

\hookrightarrow Think of these as the regular functions which "vanish" on Y

(X, \mathcal{O}_X) scheme, sheaf of ideals \mathcal{J} means $\mathcal{J}(U) \subseteq \mathcal{O}_X(U)$ ideal compatibly with restrictions.

Quasi-coherent means: \forall affine open $U, \mathcal{J}|_U$ is quasi-coherent.

Rmk $\mathcal{J} = \text{Ker of surjection } \mathcal{O}_X \rightarrow j_* \mathcal{O}_Y$

closed subscheme means: $Y \subseteq X$ closed topological space

$\cdot \mathcal{O}_Y = \mathcal{O}_X / \mathcal{J}$ some quasi-coherent sheaf of ideals \mathcal{J} on X ,

s.t. $Y \cap (\text{affine open } U) \subseteq U$ is closed affine subscheme for the ideal $\mathcal{J}(U) \subseteq \mathcal{O}_X(U)$.

Rmk \exists 1:1 correspondence $\{\text{closed subschemes of } X\} \leftrightarrow \{\text{quasi-coh. sheaves of ideals on } X\}$

Can recover $Y \subseteq X$ from \mathcal{J} from the support of $\mathcal{O}_X / \mathcal{J}$: \leftarrow if $I \subseteq p \subseteq R$ then $I \cdot R_p \neq R_p$ since $I \cdot R_p \subseteq \mathfrak{m}_p$

$$Y = \text{Supp } \mathcal{O}_X / \mathcal{J} = \{x \in X : (\mathcal{O}_X / \mathcal{J})_x \neq 0\} = \{x \in X : \mathcal{J}_x \neq \mathcal{O}_{X,x}\}$$

Example closed point $p \in X$ (so $\overline{\{p\}} = \{p\}$) \Rightarrow pick affine $p \in \text{Spec } R \hookrightarrow X$ then $p \leftrightarrow (\text{max ideal}) \subseteq R$

\Rightarrow sheaf \mathcal{J} on $\text{Spec } R \Rightarrow$ extend \mathcal{J} to X by $\mathcal{J}(V) = \mathcal{O}_X(V)$ if $p \notin V$ (so $\mathcal{O}_Y(V) = 0$)

2. GLOBAL SECTIONS AND THE FUNCTOR OF POINTS

2.0 Points of Spec R (not necessarily closed)

$$R \xrightarrow{\text{loc}} R_p \xrightarrow{\text{quotient}} K(p) = R_p / \mathfrak{m}_p \Rightarrow \text{Spec } K(p) \hookrightarrow \text{Spec } R_p \hookrightarrow \text{Spec } R$$

$$\text{loc}^{-1}(\mathfrak{m}_p) = P \leftarrow P \cdot R_p = \mathfrak{m}_p \leftarrow (0) \quad \{0\} \xrightarrow{(0)} \mathfrak{m}_p \xrightarrow{(0)} P$$

So points of Spec R correspond to the max ideals in the local rings.

2.1 Global sections and basic open sets for locally ringed spaces

(X, \mathcal{O}_X) locally ringed space $\Gamma(\cdot, \mathcal{O}_X) : \text{Top}(X)^{\text{op}} \rightarrow \text{Rings}$, sections functor

$$U \xrightarrow{\Gamma} \mathcal{O}_X(U) \xrightarrow{\text{restrict}} \mathcal{O}_X(V) \xleftarrow{\Gamma} V \xrightarrow{\Gamma} \mathcal{O}_X(V)$$

include $\uparrow U$

global sections functor: $\text{Locally Ringed Spaces}^{\text{op}} \rightarrow \text{Rings}$, $(X, \mathcal{O}_X) \mapsto \Gamma(X, \mathcal{O}_X) = \mathcal{O}_X(X)$

\exists canonical map $X \rightarrow \text{Spec } \mathcal{O}_X(X)$, $x \mapsto \text{res}_x^{-1}(\mathfrak{m}_{x,x})$ where $\text{res}_x: \mathcal{O}_X(X) \rightarrow \mathcal{O}_{X,x}$ restricts.

Trick $f \in \mathcal{O}_X(X)$ then $f_x \in \mathcal{O}_{X,x}$ invertible $\Leftrightarrow f(x) \neq 0 \in K(x) = \mathcal{O}_{X,x} / \mathfrak{m}_x$

Pf $f_x \in \mathcal{O}_{X,x} \setminus \mathfrak{m}_x = \{\text{invertibles of } \mathcal{O}_{X,x}\} \Leftrightarrow f_x \notin \mathfrak{m}_x \square$

↑ image of f via $\mathcal{O}_X(X) \rightarrow \mathcal{O}_{X,x} \rightarrow K(x)$
 $f \mapsto f_x \mapsto f(x)$

Lemma $f \in \mathcal{O}_X(X) \Rightarrow D_f = \{x \in X : f(x) \neq 0 \in K(x)\}$ is open in X. $\Leftrightarrow f \notin \mathfrak{m}_x \Leftrightarrow (f_x \in \mathcal{O}_{X,x} \text{ invertible})$

Pf Trick $\Rightarrow \exists g \in \mathcal{O}_{X,x} : f \cdot g = 1$ so \exists open $x \in U \subseteq X$ s.t. $f, g \in \mathcal{O}_X(U)$, $f \cdot g = 1 \in \mathcal{O}_X(U)$
 $\Rightarrow x \in U \subseteq D_f$ since $\forall y \in U, f_y \cdot g_y = (f \cdot g)_y = 1 \in \mathcal{O}_{X,y}$ so $f_y \in \{\text{invertibles of } \mathcal{O}_{X,y}\}$ so $f(y) \neq 0$, so $y \in D_f \square$

Lemma $f|_{D_f} \in \mathcal{O}_X(D_f)$ is invertible

Pf Lemma $\Rightarrow f$ is locally invertible. If $f \cdot h = 1$ on U then $h = g$ on $U \cap V$. So can globalise. \square
 ↑ uniqueness of inverses ($h = h \cdot 1 = h f g = 1 \cdot g = g$)

2.2 What it means to be affine

(X, \mathcal{O}_X) affine $\Leftrightarrow \exists$ ring $R : \exists X \xrightarrow{\alpha} Y = \text{Spec } R$ homeomorph, and $\exists \mathcal{O}_Y \xrightarrow{\cong} \alpha_* \mathcal{O}_X$ local on stalks

But $\mathcal{O}_Y(Y) = R$ so $R \xrightarrow{\cong} \mathcal{O}_X(X)$ so $\text{Spec } \mathcal{O}_X(X) \cong Y$.

$$\begin{array}{ccc} \varphi_x \text{ local} \implies & R \xrightarrow{\cong} \mathcal{O}_X(X) & R \supseteq \alpha(x) \xrightarrow{\cong} \text{res}_x^{-1}(\mathfrak{m}_x) \subseteq \mathcal{O}_X(X) \\ & \downarrow \varphi_x & \downarrow \varphi \\ \mathcal{O}_{Y, \alpha(x)} = R_{\alpha(x)} & \xrightarrow{\varphi_x} \mathcal{O}_{X,x} & \alpha(x) \cdot R_{\alpha(x)} \longrightarrow \mathfrak{m}_x \end{array}$$

so $X \xrightarrow{\text{canonical}} \text{Spec } \mathcal{O}_X(X) \cong Y$
 $x \mapsto \text{res}_x^{-1}(\mathfrak{m}_x) \mapsto \alpha(x)$

So a locally ringed space (X, \mathcal{O}_X) is affine precisely if:

- the canonical map $X \rightarrow \text{Spec } \Gamma(X, \mathcal{O}_X)$ is homeomorph
- $\mathcal{O}_X(D_f) \cong (\Gamma(X, \mathcal{O}_X))_f \forall f \in \Gamma(X, \mathcal{O}_X)$ and restrictions are localisations \leftarrow (by Sec. 1.12)

2.3 Functor of points

MOTIVATION Y set, you recover set Y from $\text{Mor}(\text{point}, Y)$
 Y group, " " set " " $\text{Mor}(\mathbb{Z}, Y)$

Functor of points $h_Y : \text{Sch}^{\text{op}} \rightarrow \text{Sets}$, $h_Y(X) = \text{Mor}(X, Y)$
 on morphs: $h_Y(X \xleftarrow{f} Z) = (\text{Mor}(X, Y) \xrightarrow{\circ f} \text{Mor}(Z, Y))$
MOTIVATION
 $Y = \text{Spec } \mathbb{C}[x]/(x^2+1)$. \mathbb{C} -valued points of Y ?
 $\mathbb{C}[x]/(x^2+1) \rightarrow \mathbb{C}, x \mapsto i \Rightarrow \text{morph } X = \text{Spec } \mathbb{C} \rightarrow Y \text{ so } i \in h_Y(X) \leftarrow (\text{often write } Y(\mathbb{C}))$

op = opposite category = reverse arrows
 Think: "X-valued points of Y"

HWK 1 natural transformations
Yoneda lemma $\text{Nat}(h_Y, F) \cong F(Y)$
 take image of $\text{id}_Y \in \text{Mor}(Y, Y) = h_Y(Y)$ given $F(Y)$
 Conversely given $\alpha \in F(Y), \varphi \in h_Y(X)$ get $F(\varphi)(\alpha) \in F(X)$

Yoneda embedding $h_{\bullet} : \text{Sch} \rightarrow \text{Sets}^{\text{Sch}^{\text{op}}}$ $Y \mapsto h_Y$ is fully faithful
 (iso on morphisms: $\text{Nat}(h_Y, h_W) \cong \text{Mor}(Y, W)$)

UPSHOT 1 $h_Y \cong h_W \iff Y \cong W$
 (Sets^{Sch^{op}} = category: {Obj are functors Sch^{op} → Sets, Morph are natural transformations})

2 Can now ask which functors $\text{Sch}^{\text{op}} \rightarrow \text{Sets}$ are $\cong h_Y$, i.e. represented by a scheme Y .

Example Will show that $\mathbb{A}^n = \text{Spec } \mathbb{Z}[x_1, \dots, x_n]$ represents $\text{Sch}^{\text{op}} \rightarrow \text{Sets}, X \mapsto \{\text{morphs } \bigoplus_{i=1}^n \mathcal{O}_X \rightarrow \mathcal{O}_X \text{ which are } \mathcal{O}_X\text{-linear}\}$
 ("tell me who your friends are and I will tell you who you are")
 $\text{Mor}(X, \text{Spec } R) = \text{Mor}_{\text{Sch}^{\text{op}}}(\text{Spec } R, X)$

Example 1 Y affine $\implies \text{Mor}(X, \text{Spec } R) \rightarrow \text{Hom}(R, \Gamma(X, \mathcal{O}_X))$ bijective
 $= \text{Spec } R \quad g \mapsto g_{\#} \implies \text{Spec} \& \text{ global sec. are adjoint functors}$

KEY EXAMPLE
 $Y = \mathbb{A}^1 = \text{Spec } \mathbb{Z}[x]$
 $\text{Mor}(X, \mathbb{A}^1) \cong \mathcal{O}_X(X)$
 (since $\mathbb{Z}[x] \rightarrow \mathcal{O}_X(X)$ determined by image of x)

pf. $\mathcal{O}_Y(Y) \xrightarrow{\varphi} \mathcal{O}_X(X) \rightarrow \mathcal{O}_{X,x}$ preimage of \mathfrak{m}_x gives $p \in \text{Spec } R = Y$
 $\parallel \leftarrow Y = \text{Spec } R$ defines $g: X \rightarrow Y, g(x) = p$
 $\cup \uparrow \mathfrak{m}_x$
 • g is continuous (check $g^{-1}(D_f) = D_{\varphi f}$). (see 2.1 for basic opens of locally ringed spaces)
 • $\mathcal{O}_Y(D_f) = R_f \xrightarrow{\varphi_f} \mathcal{O}_X(D_{\varphi f}) \rightarrow \mathcal{O}_X(D_{\varphi f}) = \mathcal{O}_X(g^{-1}D_f) = g_{\#} \mathcal{O}_X(D_f)$
 (natural map induced by restriction $\mathcal{O}_X(X) \rightarrow \mathcal{O}_X(D_{\varphi f})$ since φ_f invertible in $\mathcal{O}_X(D_{\varphi f})$ see 2.1)
 These are compatible with restrictions \square
 (Universal property of localisation: $R_1 \xrightarrow{\varphi} R_2$ and $\varphi(S) \subseteq \text{invertibles of } R_2 \implies \exists ! R_1 \rightarrow S^{-1}R_1 \rightarrow R_2$. Obvious: $\frac{1}{s} \mapsto \varphi(s)$)

Cor 1 (X, \mathcal{O}_X) scheme \implies canonical morph $X \rightarrow \text{Spec } \Gamma(X, \mathcal{O}_X)$
 Obvious: $\frac{1}{s} \mapsto \varphi(s)$

Explicitly: on sets $x \mapsto \text{res}^{-1}(\mathfrak{m}_{X,x}) \subseteq \mathcal{O}_X(X)$
 on sheaves over $D_f \subseteq X: \mathcal{O}_X(X)_f \xrightarrow{\text{rest}} \mathcal{O}_X(D_f)$
Rmk often not useful if X has few global sections (e.g. \mathbb{P}^n only has constants)

Rmk Canonical morph is injective if global sections separate points meaning:
 $x \neq y \in X \implies \exists f \in \Gamma(X, \mathcal{O}_X), f(x) \neq f(y)$ (equivalently $\exists f: f(x)=0, f(y) \neq 0$)

Classical algebraic geom. $X \subseteq \mathbb{A}^n$ affine variety ($X = \mathbb{V}(I), I \subseteq k[x_1, \dots, x_n]$)
 so $\Gamma(X, \mathcal{O}_X) = k[X], \mathcal{O}_X(D_f) = k[X]_f, \mathcal{O}_X(U) = \{\text{regular functions } u \mapsto k\}, \mathcal{O}_{X,a} = k[X]_{\mathfrak{m}_a}$
 separates points, and $X \xrightarrow{\text{inj.}} \{\text{closed points}\} \subseteq \text{Spec } k[X]$
 $a \mapsto \text{max ideal } \mathfrak{m}_a \subseteq k[X] \iff \text{max ideal of } \mathcal{O}_{X,a}$
 in fact get embedding $\{\text{Category of Affine Varieties}\} \hookrightarrow \text{Sch}$

Example 2 $X = \text{Spec } R$
 $m \subseteq R = \underline{\text{local ring}} \Rightarrow \left\{ f \in \text{Mor}(\text{Spec } R, Y) \right\}$ with $f(m) = y$ $\xleftrightarrow{1:1}$ $\text{Hom}_{\text{local rings}}(\mathcal{O}_{Y,y}, R)$ via $f \mapsto f^\#$

Pf (\Rightarrow) $\text{Spec } R \xrightarrow{f} Y$
 $\downarrow \quad \quad \downarrow$
 $m \longmapsto y$
 $R = \mathcal{O}_{\text{Spec } R, m} \xleftarrow{f^\#} \mathcal{O}_{Y,y}$ local hom of rings
 (if $m \in U \subseteq \text{Spec } R$ open then $U = \text{Spec } R$, since $\text{Spec } R \setminus U$ closed so if $\neq \emptyset$ then would find another max ideal)

(\Leftarrow) **Affine case** $Y = \text{Spec } S$
 $\varphi: S_y \rightarrow R \Rightarrow S \xrightarrow{\text{loc}} S_y \rightarrow R \Rightarrow \text{Spec } R \rightarrow \text{Spec } S = Y$
 $\varphi^{-1}(m) = y \cdot S_y \quad \quad m \longmapsto (\text{preimage of } \varphi^{-1}(m)) = y$
 (via $S \rightarrow S_y \cong y \cdot S_y$)

General case

$y \in U \subseteq Y$ open affine, then $\mathcal{O}_{U,y} = \mathcal{O}_{Y,y} \xrightarrow{\varphi} R$ gives $\text{Spec } R \rightarrow U \subseteq Y$

uniqueness: suppose $f: \text{Spec } R \rightarrow Y$ gives same φ
 $m \longmapsto y$

pick $y \in V \subseteq Y$ affine open $\Rightarrow f^{-1}(V)$ open $\ni m = (\text{unique closed point of } \text{Spec } R) \Rightarrow f^{-1}(V) = \text{Spec } R$
 (exercise 6 in 1.1, so trick)
 so $f: \text{Spec } R \rightarrow V \subseteq Y$ so reduce to affine case. \square

Cor 2 $x \in X \Rightarrow \exists$ canonical morph $\text{Spec } \mathcal{O}_{X,x} \rightarrow X$.

(By Example 2 for $\text{id}: \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{X,x}$) Any $\text{Spec } R \rightarrow X$ factors as $\text{Spec } R \rightarrow \text{Spec } \mathcal{O}_{X,x} \rightarrow X$ some $x \in X$.
 (local ring) $\quad \quad \quad$ (induced by a local ring hom)

(Notice in proof above we factorised through $S_y \rightarrow R$ $\mathcal{O}_{X,y}$)

Any $f: X \rightarrow Y$ of schemes get $\text{Spec } \mathcal{O}_{X,x} \rightarrow X \xrightarrow{f} Y$
 $x \mapsto y$
 $\downarrow \quad \quad \downarrow$
 $\text{Spec } \mathcal{O}_{X,x} \rightarrow \text{Spec } \mathcal{O}_{Y,y} \rightarrow Y$
 induced by $f^\#$
 $m_{X,x} \mapsto x \xrightarrow{f} y$
 $\downarrow \quad \quad \downarrow$
 $m_{Y,y} \mapsto y$

Example Case $X = \text{Spec } K$ for field K .

R local \Rightarrow residue field $K = R/m$

A local hom $R \xrightarrow{\varphi} K = \text{field}$ factors $R \xrightarrow{\text{quot.}} K \rightarrow K$

Rmk
 for a field K
 $\text{Spec } K = \{(0)\}$

(since $\ker \varphi = \varphi^{-1}(0) = m$) (since local hom)

Thus: $\left\{ f \in \text{Mor}(\text{Spec } K, Y) \right\}$ with $f((0)) = y$ $\xleftrightarrow{1:1}$ $\text{Hom}(\mathcal{O}_{Y,y}/m_{Y,y}, K)$ and any $\text{Spec } K \rightarrow Y$ factors: $(0) \mapsto y$
 $\text{Spec } K \rightarrow \text{Spec } K(y) \rightarrow Y$

UPSHOT: Morphs from local rings or fields don't give more information than already know from $\text{Spec } \mathcal{O}_{X,x} \rightarrow X$ and $\text{Spec } K(x) \rightarrow X$.

3. PROPERTIES OF SCHEMES

3.0 Useful facts from commutative algebra

R ring, M R -mod, $S \subseteq R$ multiplicative set

\Rightarrow localisation $S^{-1}M = M \times S / \text{relation } (m,s) \sim (n,t) \Leftrightarrow u \cdot (tm - sn) = 0$

which is an $S^{-1}R$ -mod and have R -mod hom $M \rightarrow S^{-1}M$ localisation map.

Fact $S^{-1}M \cong M \otimes_R S^{-1}R$ canonically \leftarrow (via $\frac{m}{s} \mapsto m \otimes \frac{1}{s}$ and $\sum \frac{r_i m_i}{s_i} \mapsto \sum m_i \otimes \frac{r_i}{s_i}$)

Exercise $\alpha: M \rightarrow N$ hom (of R -mods) $\Rightarrow \exists$ natural $S^{-1}\alpha: S^{-1}M \rightarrow S^{-1}N$

Fact Localisation is an exact functor.

Cor $S^{-1}(M/N) \cong S^{-1}M/S^{-1}N$

Pf apply S^{-1} to exact sequence $0 \rightarrow N \rightarrow M \rightarrow M/N \rightarrow 0$ \square

Fact Submods of $S^{-1}M$ have form $S^{-1}N$ for submods $N \subseteq M$ (indeed take $N = \text{preimage via } M \rightarrow S^{-1}M$)

Fact $S^{-1}M = \varinjlim M_f$ via localisation maps $M_f \rightarrow M_g$ whenever $g = fh$
 (e.g. proof: $\varinjlim M \otimes R_f = M \otimes \varinjlim R_f = M \otimes S^{-1}R$) $\frac{m}{f^n} \mapsto \frac{m h^n}{g^n}$ (induced by $R_f \rightarrow R_g$ via $M \otimes R_f \rightarrow M \otimes R_g$)

Local algebra theorem

- ① $x \in M: x = 0 \Leftrightarrow x_p = 0 \in M_p \quad \forall p \in \text{Spec } R$
- ② $M = 0 \Leftrightarrow M_p = 0 \quad \forall p \in \text{Spec } R$
- ③ $M \xrightarrow{\alpha} M' \xrightarrow{\beta} M''$ exact $\Leftrightarrow M_p \xrightarrow{\alpha_p} M'_p \xrightarrow{\beta_p} M''_p$ exact $\forall p \in \text{Spec } R$
- ④ $f: M \rightarrow N$ inj. $\Leftrightarrow f_p: M_p \rightarrow N_p$ inj. $\forall p \in \text{Spec } R$
 " surj. " surj. "
 " iso. " iso. "

same results hold if only use max ideals p .

multiplicative set $S = R \setminus p$

Pf ① $\Leftrightarrow \text{Ann}(x) = \{r \in R : rx = 0\}$ ideal \subseteq max ideal m (unless $x=0$)
 $x_m = 0 \in R_m \Rightarrow \exists r \in R \setminus m$ s.t. $rx = 0 \subseteq R \cong$

② by ①

③ $\Leftrightarrow H := \text{Ker } \beta / \text{Im } \alpha \Rightarrow H_p \cong (\text{Ker } \beta)_p / (\text{Im } \alpha)_p = \text{Ker } \frac{\beta_p}{\text{Im } \beta_p} = 0$ now use ②
 (exact $M_p \xrightarrow{\alpha_p} M'_p \xrightarrow{\beta_p} M''_p$)

④ holds since (localisation is exact) (since $0 \rightarrow \text{Ker } \beta \xrightarrow{\text{ind}} M' \xrightarrow{\beta} \text{Im } \beta \rightarrow 0$ exact $\Rightarrow 0 \rightarrow (\text{Ker } \beta)_p \rightarrow M'_p \xrightarrow{\beta_p} (\text{Im } \beta)_p \rightarrow 0$ exact, so $\text{Ker}(\beta_p) = (\text{Ker } \beta)_p$ $\text{Im}(\beta_p) = (\text{Im } \beta)_p$)

④ by ③ \leftarrow (e.g. inj means $0 \rightarrow M \xrightarrow{f} N$ exact) \square

Rmk $\text{Spec } R = \bigcup D_f$ then above results hold \Leftrightarrow hold when localise at each f_i ($1 \in \langle \text{all } f_i \rangle$)

Pf $x_i = 0 \in M_{f_i} = M \otimes R_{f_i} \Rightarrow$ localise further at $p \in \text{Spec } R_{f_i}: M_{f_i} = M \otimes_R R_{f_i} \rightarrow M \otimes_R R_p = M_p$
 (Note every $p \in \text{Spec } R$ is in some $D_{f_i} = \text{Spec } R_{f_i}$) $0 = x_i \mapsto x_p$, so 0 . \square

3.1 Noetherian

f.g. = finitely generated

Recall: ring R is Noetherian \Leftrightarrow ideals of R are f.g. \Leftrightarrow submods of f.g. R -mods are f.g. \Leftrightarrow ascending family of ideals in R stabilise ("ascending chain condition" ACC)

Rmk localisation and quotients preserve Noetherian property

Def scheme (X, \mathcal{O}_X) is Noetherian if quasi-compact and **locally Noetherian**

Def An affine open (for the ring R) means an open subset $U \subseteq X$ admitting an isomorphism

$$(U, \mathcal{O}_X|_U) \cong (\text{Spec } R, \mathcal{O}_{\text{Spec } R}) \text{ for some ring } R.$$

Note: $\mathcal{O}_X(U) \cong R$

Claim The following are equivalent definitions for (X, \mathcal{O}_X) to be locally Noetherian

- 1) every point has an affine open neighbourhood U with $\mathcal{O}_X(U)$ Noetherian
- 2) $X = \cup U_i$ for open affines U_i with $\mathcal{O}_X(U_i)$ Noetherian
- 3) given any open affine for a ring R , R must be Noetherian

Pf (1) \Leftrightarrow (2) and (3) \Rightarrow (1) since schemes are locally affine.

(1) & (2) \Rightarrow (3): consider $\text{Spec } R \cong U \subseteq X$

$\forall p \in U, \exists$ affine open $p \in V = \text{Spec } S$ with S Noetherian (by (1))

$\Rightarrow \exists$ basic open $p \in D_g \subseteq U$ for $\text{Spec } S$, some $g \in S$
 $= \text{Spec } (S_g)$ and S_g Noeth. (since S Noeth.)

By the USEFUL TRICK, WLOG D_g is basic also for $\text{Spec } R$, say $\text{Spec } R_f$.

Since $\text{Spec } S_g \cong \text{Spec } R_f$ get $S_g \cong R_f$ so Noetherian. Get cover for U ,

so need: Algebra Lemma R_{f_i} Noeth. $\forall i$ $\Rightarrow R$ Noeth.
 $\langle \text{all } f_i \rangle \ni 1$ \leftarrow by "Covering Trick"

USEFUL TRICK R, S rings
 $p \in \text{Spec } R \cap \text{Spec } S = Y \subseteq X$
 $\Rightarrow \exists$ open $p \in D \subseteq Y$
 which is basic for both R, S .
 Pf \exists basic $p \in D_r \subseteq Y$ for R and
 \exists basic $p \in D_s \subseteq D_r$ for S as
 $\Rightarrow s \in S = \Gamma(\text{Spec } S, \mathcal{O}_X)$
 \downarrow restrict
 $h \in \Gamma(D_r, \mathcal{O}_X) \cong R_r$
 $\Rightarrow h = \frac{a}{r_n}$ so $(R_r)_h = R_{ar}$
 $\Rightarrow D_s = \{x \in D_r : s(x) \neq 0\}$
 $\cong \text{Spec } S_s = \{x \in D_r : h(x) \neq 0\}$
 $= \text{Spec } R_{ar} = D_{ar}$

proof $I \subseteq R$ ideal (aim: I is f.g.)

$\Rightarrow I_{f_i} := I \cdot R_{f_i} \subseteq R_{f_i}$ ideal, f.g. since R_{f_i} Noeth., say generators $g_{ij} = \frac{h_{ij}}{f_i^N}$

$\Rightarrow \frac{h_{ij}}{f_i^N} = f_i^N \cdot g_{ij} \in I$ also generate (since $\frac{1}{f_i^N} \in R_{f_i}$)

$\Rightarrow \bigoplus_{ij} R \xrightarrow{\varphi} I$, $e_{ij} \mapsto h_{ij}$ satisfies φ_{f_i} surjective $\forall f_i$ so φ surj. \square
 (since $\varphi_{f_i}(e_{ij}) = \frac{h_{ij}}{f_i^N}$ generate) use Sec. 2.0

Exercise give an alternative proof of algebra lemma by proving the ACC for R

(Key trick: $I = \bigcap \varphi_i^{-1}(I_{f_i})$ where $\varphi_i: R \rightarrow R_{f_i}$ is localisation.
 You may need the famous Trick: $\text{Spec } R = D_{f_1^N} \cup \dots \cup D_{f_n^N}$ so $\sum r_i f_i^N = 1$)

3.2 Properties that are affine-local

Above we had a property \star of affine opens ("ring is Noetherian") satisfying Affine-local conditions

- 1) $\text{Spec } R \hookrightarrow X \star \Rightarrow \text{Spec } R_f \hookrightarrow X \star \quad \forall f \in R$
- 2) $\text{Spec } R = \cup D_{f_i}, \text{Spec } R_{f_i} \hookrightarrow X \star \Rightarrow \text{Spec } R \hookrightarrow X \star$

so property is preserved by localisation
 can globalise from basic affines to affine

Claim $X = \cup \text{Spec } R_i$: each has $\star \implies$ every open affine in X has $\star \leftarrow$ "if holds for a cover, it holds \forall affine open"

Pf $\text{Spec } R \hookrightarrow X \implies \text{Spec } R = \bigcup_{\text{finite}} D_{f_{ij}}, D_{f_{ij}} \subseteq \text{Spec } R_i \xrightarrow{(1)} D_{f_{ij}} \star \xrightarrow{(2)} \text{Spec } R \star \square$

Examples of \star : "ring is reduced", "ring is Noeth.", "ring is f.g. B-algebra" (use USEFUL TRICK in 3.1)
 "locally of finite type over B" \leftarrow some fixed ring B ("base")

3.3 Reduced schemes

(X, \mathcal{O}_X) reduced if all $\mathcal{O}_X(U)$ reduced rings (=no nilpotents $\neq 0$)

so \exists surj. hom of B-alg. $B[x_1, \dots, x_n] \rightarrow \text{ring}$ | e.g. field k : Affine vars $X \subseteq \mathbb{A}^n$ loc. finitetype/ k .

Hwk 1 reduced \iff stalks $\mathcal{O}_{X,x}$ are reduced \leftarrow (so "stalk-local property")
 $\iff \forall p \in X$ has an open affine neighbourhood for a reduced ring

Rmk By 3.2: $\text{Spec } R$ reduced $\iff R$ reduced

Lemma X reduced, $f, g \in \mathcal{O}_X(U)$ take same values $f(x) = g(x) \in K(x) = \mathcal{O}_{X,x} / \mathfrak{m}_x \implies f = g$

Pf. Take $f-g$, wlog $g=0$. On affine, $K(p) \cong \text{Frac}(R_p)$ so $f \in \bigcap p = \text{Nilradical}(R) = \{\text{nilpotents}\} = \{0\}$.

(Don't confuse this with general fact \forall scheme: $f_x = g_x \in \mathcal{O}_{X,x} \forall x \in U \implies f = g \in \mathcal{O}_X(U)$)

Claim (not that strong a condition e.g. $f, g: \mathbb{C} \rightarrow \mathbb{C}, f(z) = z, g(z) = \bar{z}$ different, but $f(0) = g(0), \text{Spec } \mathbb{C} = \{0\}$)

X reduced, $f, g: X \rightarrow Y, f = g$ as topological maps, $f = g$ on open dense set $\implies f = g$. $g^{-1}(\text{Spec } R)$

Pf enough show $f = g$ locally by sheaf property. wlog $Y = \text{Spec } R, X = \text{Spec } S$ (pick $\text{Spec } S \subseteq f^{-1}(\text{Spec } R)$)

$\varphi := f^\# - g^\#: R \rightarrow S$: to show φ vanishes it is enough to show $s = \varphi(1) \in S$ is zero $\leftarrow (\varphi(r) = \varphi(r \cdot 1) = \varphi(r) \cdot \varphi(1))$

$\{p \in \text{Spec } S : s(p) = 0 \in K(p)\} = \mathcal{V}(s)$ closed & contains an open dense set, hence $s = 0$ by Lemma \square
 \leftarrow since $\{p : s(p) = 0 \in \mathcal{O}_{X,p}\}$ contains open dense set by assumption

3.4 Irreducible schemes

Def Topological space X is irreducible if X is not a union of 2 proper closed sets:
 $X = C_1 \cup C_2 \implies X = C_1$ or $X = C_2$ (where C_i closed)

Easy exercise If X irreducible:
 • Any non-empty open $U \subseteq X$ is dense and irreducible
 • Any two " " U_1, U_2 have $U_1 \cap U_2 \neq \emptyset$ (open, dense, irred)

Recall: $\text{Nil}(R) = \text{nilradical}(R) = \{\text{nilpotent elements}\} = \sqrt{(0)} = \bigcap \{p \in \text{Spec } R\}$ (R ring)

Hwk 2 (X, \mathcal{O}_X) irreducible \iff all affine opens are irreducible

Hwk 1 $\text{Spec } R$ irreducible \iff $\text{Nil}(R)$ prime ideal \implies
 $\iff R/\text{Nil}(R)$ integral domain
 $\iff \exists!$ generic point, namely $\text{Nil}(R)$

Example $\mathcal{V}(I) = \text{Spec}(R/I) \subseteq \text{Spec } R$
 irreducible $\iff \sqrt{I}$ prime ideal.
 Since $\mathcal{V}(I) = \mathcal{V}(\sqrt{I})$ as sets, irred. closed subsets of $\text{Spec } R$ are: $\mathcal{V}(p)$ for $p \in \text{Spec } R$. So: irred. components: if p minimal \leftarrow (irred. & max w.r.t. \subseteq) \leftarrow (w.r.t. \subseteq)

Recall $p \in X$ generic point if closure $\bar{p} = X$ (p is dense)

Claim (X, \mathcal{O}_X) irreducible $\implies \exists!$ generic point y , and $y \in$ every affine open $\neq \emptyset$

Pf affine open $\emptyset \neq U \subseteq X \xrightarrow{\text{ex. above}} U$ irred. $\xrightarrow{\text{Hwk 1}} \exists!$ generic pt $x \in U \implies \bar{x} \supseteq \bar{U} = X$ (\bar{x} in X closed and $\geq U$)

Suppose $y \in X$ generic \implies if $y \in X \setminus U$ then $\bar{y} \subseteq \overline{X \setminus U} = X \setminus U$ not dense, so $y \in U$, so $y = x$. \square

Hwk 2 irreducible \iff connected. Fact $\text{Spec } R$ connected \iff no idempotents $\neq 0, 1$
 \leftarrow Classifies connected components of $\text{Spec } R$ in terms of idempotents $\leftarrow r \in R$ with $r^2 = r$

Exercise R Noetherian $\implies \exists!$ sequence of prime ideals p_1, \dots, p_n (up to reordering): $\left\{ \begin{array}{l} \bigcap p_i = \text{Nil}(R) \\ p_i \not\subseteq \bigcap_{j \neq i} p_j \end{array} \right.$
 (Same Pf. as in C3.4) \leftarrow (in fact they are the minimal prime ideals of R)

$\implies \exists!$ sequence of irred. closed subsets $C_i = \mathcal{V}(p_i)$ (up to reordering): $\text{Spec } R = \bigcup C_i, C_i \not\subseteq \bigcup_{j \neq i} C_j$
 \leftarrow (which as top. subspaces are the irreducible components) as topological spaces

Warning: $\mathfrak{q} = (x^2) \subseteq k[x] = R \implies \mathfrak{p} = \text{Nil}(R) = (x), C = \text{Spec}(R/\mathfrak{p}) = \{0\} = \text{Spec}(R/\mathfrak{q})$ as top. spaces, not as schemes

Non-examinable (see C3.4 Notes on Lasker-Noether theorem)

To recover the scheme $\text{Spec}(R) = \bigcup \mathbb{V}(q_i)$, $\mathbb{V}(q_i) \not\subseteq \bigcup_{j \neq i} \mathbb{V}(q_j)$ need primary decomposition (like "unique factorization" but for ideals)

(so "irredundant": can't omit q_i)

$\{0\} = q_1 \cap q_2 \cap \dots \cap q_n \cap \dots \cap q_m$ where q_i are primary ideals s.t. $q_i \not\subseteq \bigcap_{j \neq i} q_j$

$q \subseteq R$ primary ideal if zero divisors of R/q are nilpotent (Equivalently: $ab \in q \Rightarrow a \in q$ or $b \in q$ or $b^N \in q$ for some N (\Leftrightarrow if $a, b \notin q$ then $a, b \in \sqrt{q}$))

Rmk $p = \sqrt{q}$ is prime ideal ("associated prime ideal") and is smallest prime ideal containing q .
So: $ab \in q, a \notin q \Rightarrow b \in p$

Example p^n is primary if p prime ideal, e.g. $(3^4) \subseteq \mathbb{Z}$

Example $(18) = (2 \cdot 3^2) = (2) \cap (3^2) \subseteq \mathbb{Z}$ is primary decomposition.

The q_i are not unique, but the $p_i = \sqrt{q_i}$ are unique (up to reordering)

(the p_i are precisely the prime ideals arising as radicals of annihilators of elts of R)

$(\mathbb{V}(q_i) = \mathbb{V}(p_i))$
(as closed sets)

The $\mathbb{V}(q_i)$ are called primary components: not unique as schemes, but are unique topologically.

• WLOG $p_1 = \sqrt{q_1}, \dots, p_n = \sqrt{q_n}$ are as in previous exercise: the minimal prime ideals
(so $\text{Nil}(R) = p_1 \cap \dots \cap p_n$, which is the primary decomposition for $R/\text{Nil}(R)$)

give the isolated components $\mathbb{V}(q_i)$ (as top. subspace = $\mathbb{V}(p_i)$: irreducible comp.). These q_1, \dots, q_n are unique.

• The other q_{n+1}, \dots, q_m give rise to the embedded components $\mathbb{V}(q_j), j > n+1$ (not unique).

(Note $p_j \supseteq p_i$ some i , so $\mathbb{V}(p_j) \subseteq \mathbb{V}(p_i) \subseteq \mathbb{V}(q_i)$ are closed subschemes, but $\mathbb{V}(q_j) \not\subseteq \mathbb{V}(p_i)$ as scheme)

Rmk Can apply above to R/\mathbb{I} to get $\sqrt{\mathbb{I}} = p_1 \cap \dots \cap p_n, \mathbb{I} = q_1 \cap \dots \cap q_n \cap \dots \cap q_m$, etc.

Example $\mathbb{I} = (y^2, xy) \subseteq k[x, y] = R, X = \text{Spec}(R/\mathbb{I}) =$

$\sqrt{\mathbb{I}} = q_1, \mathbb{I} = q_1 \cap q_2$ for $q_1 = (y), p_1 = (y)$ min prime, $\mathbb{V}(q_1)$ is isolated, irreducible
 $q_2 = (x, y)^2, p_2 = (x, y)$ embedded prime, $\mathbb{V}(q_2)$ = "fattened origin" is embedded
Think: functions vanishing on x -axis in \mathbb{A}^2 , and "order 2 at 0."
annihilator of $x \in R/\mathbb{I}$
order 2, 2 = max length of ideals in \mathcal{O}_{X, p_2} (max length of chain of ideals $\mathcal{O}_{X, p} \not\supseteq \mathbb{I}_1 \not\supseteq \dots \not\supseteq \mathbb{I}_2 = 0$)
In example: $\mathbb{I}_1 = (x, y) \supseteq 0 = \mathbb{I}_2$
not unique, e.g. could also pick (y^2, x) .

3.5 Integral schemes

(X, \mathcal{O}_X) integral if all $\mathcal{O}_X(U)$ ID (integral domain = no zero divisors $\neq 0$)

Hwk 2 $\Leftrightarrow \mathcal{O}_X(U)$ ID \forall affine open U

Fact Localisation Direct limits \varinjlim } preserve ID property

Cor X integral $\Rightarrow \mathcal{O}_{X, x}$ ID (but not \Leftarrow)

2 Key Non-examples

 $k[x, y]/(x^2)$ not reduced
 $k[x, y]/(xy) \cong k[x] \oplus k[y]$ reducible: union of two axes

nonexaminable fact if X is locally Noeth: X integral \Leftrightarrow $\begin{cases} \bullet$ connected
 \bullet $X = \bigcup \text{Spec } R_i$
 R_i integral

Hwk 2 X integral \Leftrightarrow reduced and irreducible

$\text{Spec } R$ integral $\Leftrightarrow R$ integral domain \leftarrow Example All irreducible affine varieties $X \subseteq \mathbb{A}^n$ ($\text{Spec } k[X]$)

Claim (X, \mathcal{O}_X) integral \Rightarrow restrictions $\mathcal{O}_X(U) \rightarrow \mathcal{O}_X(V)$ are injective (for $V \neq \emptyset$)

\Rightarrow • all sections can be compared in $\mathcal{O}_{X, y} \leftarrow y = \text{generic point}$

• $K(y) \cong \mathcal{O}_{X, y} \cong \text{Frac } \mathcal{O}_X(U)$ via restriction (any $U \neq \emptyset$) \leftarrow called function field $K(X)$

Pf $\mathcal{O}_X(U) \rightarrow \mathcal{O}_X(V) \rightarrow \mathcal{O}_{X, y}$ so enough show $s_y = 0 \Rightarrow s = 0$.

If show $s = 0$ on every open affine $\subseteq U$ then $s_x = 0$ all $x \in U$ so $s = 0 \in \mathcal{O}_X(U)$.

\Rightarrow WLOG $U = \text{Spec } R, y = \text{Nil}(R) = \{0\}$ (since R is ID), so $\mathcal{O}_X(U) \rightarrow \mathcal{O}_{X, y}$ becomes

$R \hookrightarrow R_{(0)} = \text{Frac } R, r \mapsto \frac{r}{1}$ inj. since R is ID. Thus $s_y = 0 \Rightarrow s = 0 \quad \square$

Classical Alg. Geometry $X \subseteq \mathbb{A}^n$ irred. affine var $\Rightarrow \mathcal{O}_X(X) \rightarrow \mathcal{O}_X(D_f) \rightarrow \mathcal{O}_{X, p} \quad k(X)$
(so $\text{Spec } k[X]$) $\quad \quad \quad \parallel \quad \quad \quad \parallel \quad \quad \quad \parallel \quad \quad \quad \parallel$
 $k[X] \subseteq k[X]_f \subseteq k[X]_p \subseteq \text{Frac } k[X]$

3.6 Properties of morphisms ← all properties we list are preserved when compose such morphs

A morph of schemes $f : X \rightarrow Y$ is: (will suppress $f^\#, \mathcal{O}_X, \mathcal{O}_Y$ from notation)

- ① affine: equivalent conditions:
- $f^{-1}(\text{affine open})$ is **affine**
 - \exists affine open cover V_i of Y , $f^{-1}(V_i)$ **affine**
 - \forall affine open cover V_i of Y , $f^{-1}(V_i)$ **affine**

- ② quasi-compact: replace **affine** by **quasi-compact**

- ③ locally of finite type:
- \forall affine opens $U \subseteq X, V \subseteq Y$ with $f(U) \subseteq V$, $f^\# : \mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(U)$ finite type
 - (meaning: $\mathcal{O}_Y(V) \xrightarrow{f^\#} \mathcal{O}_X(f^{-1}V) \xrightarrow{\text{rest}} \mathcal{O}_X(U)$)
 - \exists open affine covers $Y = \cup V_i, f^{-1}(V_i) = \cup U_{ij}$
 - $f^\# : \mathcal{O}_Y(V_i) \rightarrow \mathcal{O}_X(U_{ij})$ finite type

(Rings: $A \rightarrow B$ finite type means B f.g. as A -alg., i.e. \exists surj $A[x_1, \dots, x_n] \rightarrow B$ of A -algs)

- ④ finite type: ② + ③: quasi-compact & locally finite type

- ⑤ closed immersion: iso onto a closed subscheme.

Explicitly: $f : X \xrightarrow{\text{homeo}} f(X) \subseteq_{\text{closed}} Y$

$f^\# : \mathcal{O}_Y \rightarrow f_* \mathcal{O}_X$ surjective (so ideal sheaf $\mathcal{J} = \text{Ker } f^\#$)

- \forall aff. open $U = \text{Spec } R \subseteq Y \exists$ ideal $I \subseteq R$ s.t. $f^{-1}(U) \cong \text{Spec}(R/I)$
- $f \downarrow \cong \downarrow \text{Spec } R$
- \exists aff. cover $Y = \cup \text{Spec } R_i$, ideals $I_i \subseteq R_i, f^{-1}(\text{Spec } R_i) = \text{Spec}(R_i/I_i)$

Idea: functions on X are restrictions of functions of Y

automatically quasi-coherent.

Rmk Can specify an ideal $I \subseteq R$ by a surjective ring hom $R \rightarrow S$ (get $I = \text{Ker}$)

Conversely given I consider $S = R/I$

Example $X = Y_{\text{red}} \subseteq Y$ closed subscheme: $X = Y$ as topological space and (reduction of Y : it's reduced) sheaf of ideals $\mathcal{J}(U) = \{s \in \mathcal{O}_Y(U) : s(p) = 0 \forall p \in U\}$ (so $\mathcal{O}_X = \mathcal{O}_Y/\mathcal{J}$)

Note locally: on $U = \text{Spec } R, \mathcal{J}(U) = \{s \in R : s \in \cap_p \text{Nil}(R) = \{\text{nilpotents}\}\}$, so locally \mathcal{J} agrees with $\text{Nil}(\mathcal{O}_Y)$, indeed \mathcal{J} is the sheafification of $\text{Nil}(\mathcal{O}_Y)$ ← need not be sheaf, e.g. $Y = \bigsqcup_n Y_n, Y_n = \text{Spec}(\mathbb{Z}/2^n)$ $2 \in \mathcal{O}_Y(Y), 2 \notin \text{Nil}(\mathcal{O}_Y(Y))$ but $2 \in \text{Nil}(\mathcal{O}_Y(Y_n)), 2 \in \mathcal{J}(X)$

- ⑥ open immersion: iso onto an open subscheme ← $U \subseteq Y, \mathcal{O}_U = \mathcal{O}_Y|_U$
- Explicitly: $f : X \xrightarrow{\text{homeo}} f(X) \subseteq_{\text{open}} Y$
- $f^\# : \mathcal{O}_Y \rightarrow f_* \mathcal{O}_X$ iso (\Leftrightarrow iso on stalks $f^\#_x : \mathcal{O}_{Y, f_x} \rightarrow \mathcal{O}_{X, x}$)
- (idea: functions on X are the same as " " Y locally)

- ⑦ flat: all $\mathcal{O}_{Y, f_x} \rightarrow \mathcal{O}_{X, x}$ are **flat ring homs**

Not intuitively clear, but ensures that fibers of f vary in a controlled way: Many invariants of fibers like dimension, do not change unless you "expected" it! It is weaker than saying the fibers are locally iso e.g. it allows two points to collide as vary fiber.

Algebra: R -mod M is flat if $M \otimes_R \cdot$ is exact functor on R -mods

$\varphi : R \rightarrow S$ flat ring hom means S flat R -mod (using $r \cdot s = \varphi(r)s$)

Basic facts

- 1) $M \otimes_R \cdot$ always right exact, so M flat R -mod $\Leftrightarrow N_1 \hookrightarrow N_2$ implies $M \otimes_R N_1 \hookrightarrow M \otimes_R N_2$
- Fact Enough to check $M \otimes_R I \hookrightarrow M \otimes_R R \forall$ f.g. ideal $I \subseteq R$.
- 2) M free $\Rightarrow M$ flat (Pf. $M \cong \bigoplus_{i \in I} R \Rightarrow M \otimes N \cong \bigoplus_{i \in I} N$. \square)

3) R local, M finite R -mod (so $M = \sum_{\text{finite}} R m_i$): M flat $\Leftrightarrow M$ free

$\theta_{y, f(x)}$ local but $\theta_{x, x}$ is rarely finite over it

4) $A \rightarrow B$ flat, $B \rightarrow C$ flat $\Rightarrow A \rightarrow C$ flat

Pf $N_1 \hookrightarrow N_2$ A -mods $\Rightarrow B \otimes_A N_1 \hookrightarrow B \otimes_A N_2$ B -mods $\Rightarrow C \otimes_B B \otimes_A N_1 \hookrightarrow C \otimes_B B \otimes_A N_2$ \square

5) $A \rightarrow B$ flat $\Rightarrow A_p \rightarrow B_p = B \otimes_A A_p$ flat $\forall p \in \text{Spec } A$

Pf $N_1 \hookrightarrow N_2$ A_p -mods $\Rightarrow N_1 \hookrightarrow N_2$ A -mods (via $A \rightarrow A_p$) $\Rightarrow B \otimes_A N_1 \hookrightarrow B \otimes_A N_2$ \square

6) Ring hom $\varphi: A \rightarrow B$, multiplicative sets $S \subseteq A, T \subseteq B$ with $\varphi(S) \subseteq T$, then $\psi: S^{-1}B \rightarrow T^{-1}B$, $\frac{a}{s} \otimes b \mapsto \frac{\varphi(a)b}{\varphi(s)}$ factorizes as $S^{-1}B \xrightarrow{\cong} (\varphi(S))^{-1}B \xrightarrow{\psi} T^{-1}B$

Since isos of rings and localisation are exact functors, get ψ flat.

Example: $\mathfrak{p} \subseteq B$ prime ideal, $\mathfrak{q} = \varphi^{-1}\mathfrak{p} \subseteq A$ prime ideal, $S = A \setminus \mathfrak{q}, T = B \setminus \mathfrak{p} \Rightarrow B_{\mathfrak{q}} = B \otimes_A A_{\mathfrak{q}} \rightarrow B_{\mathfrak{p}}$ flat

Theorem $\varphi: A \rightarrow B$ flat ring hom $\Leftrightarrow \varphi^\#: \text{Spec } B \rightarrow \text{Spec } A$ flat

Pf \Rightarrow $A \rightarrow B$ flat $\Rightarrow A_{\mathfrak{q}} \rightarrow B_{\mathfrak{q}}$ flat for $\mathfrak{q} = \varphi^{-1}\mathfrak{p}$ by (5), $B_{\mathfrak{q}} \rightarrow B_{\mathfrak{p}}$ flat by (6) $\stackrel{(3)}{\Rightarrow} A_{\mathfrak{q}} \rightarrow B_{\mathfrak{p}}$ flat.

\Leftarrow Recall $\text{Ker}(B \otimes_A N_1 \xrightarrow{\psi} B \otimes_A N_2) \neq 0 \Leftrightarrow \text{Ker } \psi_p \neq 0 \forall p \in \text{Spec } B$

$\text{Ker}(N_1 \rightarrow N_2) = 0 \Rightarrow \text{Ker}(A_{\mathfrak{q}} \otimes_A N_1 \rightarrow A_{\mathfrak{q}} \otimes_A N_2) = 0 \Rightarrow \text{Ker}(B_{\mathfrak{p}} \otimes_{A_{\mathfrak{q}}} A_{\mathfrak{q}} \otimes_A N_1 \rightarrow B_{\mathfrak{p}} \otimes_{A_{\mathfrak{q}}} A_{\mathfrak{q}} \otimes_A N_2) = 0$ \square

Motivation (see Homework 2 ex. 6)

Flatness \Rightarrow 1-parameter families of schemes have "limits".

Fact $B = \text{Spec } k[t]$
 $B^* = B \setminus 0 = \text{Spec } k[t, t^{-1}]$
 $X \subseteq \mathbb{A}_B^n$ closed subscheme
 $\pi: X \rightarrow B$

defined rigorously later in S.1, for now $X_b = \pi^{-1}(b) = \text{Spec } K(b) \times_B X = \text{Spec}(K(b) \otimes_{k[t]} R)$ if $X = \text{Spec } R$
 fiber X_0 is "limit" $\lim_{b \rightarrow 0} X_b$
 $(\lim_{b \rightarrow 0} X_b$ means: fiber over 0 of closure of $X^* = \pi^{-1}(B^*)$ so $\Leftrightarrow \overline{X^*} = X$)
 (see S.1: $B^* \times_B X$)

Fact Another nice properties of flat morphs $f: X \rightarrow B$, for B, X locally Noeth.:
 $\dim_x f^{-1}(b) = \dim_x X - \dim_b B$ where $b = f(x)$

So dimensions of fibers don't "jump" unexpectedly.

$\dim_x X = \max$ length d of chain of irreducible closed $Z_i: \{x\} \subseteq Z_0 \subsetneq Z_1 \subsetneq Z_2 \subsetneq \dots \subsetneq Z_d \subseteq U$ minimizing over open $x \in U \subseteq X$

Geometrical motivation (very loosely)

$X_t = \mathbb{V}(xy-t) \subseteq \mathbb{A}^2$ $X_0 = \mathbb{V}(xy)$

how many times does a line in \mathbb{A}^2 intersect fiber?

if have a family for which intersection number is constant, it may be easy to calculate for a degenerate fiber

example: \mathbb{A}^2 has $\dim=2$
 $\{p\} \subseteq \text{line} \subseteq \text{plane}$
 \parallel
 $Z_0 \subseteq Z_1 \subseteq Z_2$

in such theorems you will almost always see the flatness assumption

$X = \mathbb{V}(xy-t) \subseteq \mathbb{A}^3 = \text{Spec } k[t, x, y]$
 \downarrow
 $\mathbb{A}^1 = \text{Spec } k[t]$

Remarks about calculating closures of sets in $X = \text{Spec } R$

1) $p \in \text{Spec } R \Rightarrow \boxed{\bar{p} = V(p)}$

Pf $p \in V(p) \Rightarrow \bar{p} \subseteq V(p)$ (since $V(p)$ closed)

Converse: $p \in \bar{p} = V(I) \Rightarrow I \subseteq p \Rightarrow I \subseteq p \subseteq q \Rightarrow q \in V(I) \square$
 $q \in V(p) \Rightarrow p \subseteq q$

Example $X^* = V_*(p_1 \cdot p_2 \cdots p_k) \subseteq \mathbb{A}_{B^*}^n$, $B^* = \text{Spec } R[t, t^{-1}]$, $p_i \in R[x_1, \dots, x_n, t, t^{-1}]$ prime ideals
 $= V_*(p_1) \cup \dots \cup V_*(p_k)$ where $V_*(\cdot)$ is $V(\cdot)$ calculated in $\mathbb{A}_{B^*}^n$
 $\Rightarrow \bar{X}^* = V(p_1) \cup \dots \cup V(p_k) \subseteq \mathbb{A}_B^n$ since $p_i \in X^* \subseteq \bar{X}^*$ and $p_i \in V_*(p_i) \subseteq V(p_i) = \bar{p}_i$
 $= V(p_1 \cdot p_2 \cdots p_k)$

Recall topology:
 X topological space
 $Y \subseteq X$ top. subspace
 $\bar{Y} = \bigcap_{C \text{ closed}, Y \subseteq C} C$
 so any closed $C \supseteq Y$ satisfies $\bar{Y} \subseteq C$. Also:
 $\overline{Y_1 \cup \dots \cup Y_n} = \bar{Y}_1 \cup \dots \cup \bar{Y}_n$
Pf $Y_i \subseteq Y_1 \cup \dots \cup Y_n \Rightarrow \bar{Y}_i \subseteq \overline{Y_1 \cup \dots \cup Y_n}$
 converse:
 $Y_1 \cup \dots \cup Y_n \subseteq \underbrace{\bar{Y}_1 \cup \dots \cup \bar{Y}_n}_{\text{closed}}$
 $\Rightarrow \overline{Y_1 \cup \dots \cup Y_n} \subseteq \bar{Y}_1 \cup \dots \cup \bar{Y}_n$

2) For $\varphi: R \rightarrow S$ ring hom, $\alpha: \text{Spec } S \rightarrow \text{Spec } R$, $\alpha(p) = \varphi^{-1}p$:

Given $C = V(J) \subseteq \text{Spec } S$, $\boxed{\alpha(C) = V(\varphi^{-1}J)}$
radical

Pf $J = \sqrt{J} = \bigcap_{\substack{J \subseteq p \\ p \in \text{Spec } S}} p \Rightarrow \varphi^{-1}J = \bigcap_{\substack{I \subseteq p \\ \alpha(p) = \varphi^{-1}p \in V(\varphi^{-1}J)}} p$
 since $\alpha(C) \subseteq \overline{\alpha(C)} = V(I)$, $I \subseteq \varphi^{-1}p \Rightarrow I \subseteq \varphi^{-1}J \Rightarrow V(I) \supseteq V(\varphi^{-1}J) \square$
say
 $\varphi^{-1}(p) \leftarrow \forall p \in \text{Spec } S, J \subseteq p$
 $\alpha C \subseteq V(\varphi^{-1}J)$
 $\varphi^{-1}J \subseteq \varphi^{-1}p$
 $\parallel \alpha C$
 $\cup \alpha C$

Example $S = R_f$ localisation, $f \in R$, if $\varphi: R \hookrightarrow R_f$ injection then $\varphi^{-1}J = R \cap J$ in (iii)

e.g. $X^* = V(J) \subseteq \mathbb{A}_{B^*}^n$ for $B = \text{Spec } R[t]$, $B^* = \text{Spec } R[t, t^{-1}]$
 so $\mathbb{A}_B^n = \text{Spec } R[x_1, \dots, x_n, t]$, $\mathbb{A}_{B^*}^n = R[x_1, \dots, x_n, t, t^{-1}]$

$\Rightarrow \boxed{\bar{X}^* = V(R[x_1, \dots, x_n, t] \cap J) \subseteq \mathbb{A}_B^n}$ is the closure

Rmk Also know inverse images of closed sets: $\boxed{\alpha^{-1}(V(I)) = V(\langle \varphi I \rangle)}$

Pf $I = \langle f_i \rangle$, $\text{Spec } R \setminus V(I) = \cup D_{f_i}$,
 $\cup D_{\varphi f_i} = \alpha^{-1}(\cup D_{f_i}) = \alpha^{-1}(\text{Spec } R \setminus V(I)) = \text{Spec } S \setminus \alpha^{-1}V(I)$
by (i)
 $\Rightarrow \alpha^{-1}V(I) = \text{Spec } S \setminus \cup D_{\varphi f_i} = V(\langle \varphi f_i \rangle) \square$

4. GLUING THEOREMS

4.1 Gluing sheaves

$X = \cup U_i$ open cover, abbreviate $U_{ij} = U_i \cap U_j$, $U_{ijk} = U_i \cap U_j \cap U_k$

F_i sheaf on U_i

$$\varphi_{ij} : F_i|_{U_{ij}} \xrightarrow{\sim} F_j|_{U_{ij}}$$

Compatibility conditions

- 1) $\varphi_{ii} = \text{id}$
- 2) $\varphi_{ji} = \varphi_{ij}^{-1}$
- 3) $\varphi_{ik}|_{U_{ijk}} = \varphi_{jk} \circ \varphi_{ij}|_{U_{ijk}}$

Example F sheaf on X , $F_i := F|_{U_i}$ (so $F_i(V) = F|_{U_i}(V) = F(U_i \cap V)$, \forall open $V \subseteq U_i$)

φ_{ij} = isos induced by double restrictions (iso of functors $\cdot|_{U_i}|_{U_{ij}} \cong \cdot|_{U_j}|_{U_{ij}}$)

Theorem \exists , up to unique iso, a sheaf F on X with isos

$$\psi_i : F|_{U_i} \xrightarrow{\sim} F_i$$

s.t. $\psi_j^{-1} \circ \varphi_{ij} \circ \psi_i|_{U_{ij}}$ is the natural iso $F|_{U_i}|_{U_{ij}} \cong F|_{U_j}|_{U_{ij}}$

df Let $E = \bigsqcup_i \bigsqcup_{x \in U_i} (F_i)_x$ / equivalence relation $(F_i)_x \xrightarrow[\varphi_{ij}]{\cong} (F_j)_x$ for $x \in U_{ij}$

$F(U) = \{s : U \rightarrow E : s \text{ is locally a section of some } F_i\}$. \square

($\forall x \in U, \exists i, \exists$ open $x \in V_i \subseteq U_i, \exists t \in F_i(V_i), s(y) = t_y \forall y \in V_i$)

Theorem Given sheaves F, G constructed as above from local data F_i, φ_{ij} on U_i ; G_i, ψ_{ij}

a morph $f : F \rightarrow G$ can be uniquely defined from data:

- morphs $f_i : F_i \rightarrow G_i$
- compatibility condition: $\psi_{ij} \circ f_i|_{U_{ij}} = f_j|_{U_{ij}} \circ \varphi_{ij}$

s.t. via identifications $F|_{U_i} \cong F_i, G|_{U_i} \cong G_i$ recover $f|_{U_i} = f_i$

4.2 Gluing schemes

U_i schemes, $U_{ij} \subseteq U_i$ open subschemes ($U_{ii} = U_i$)

$\varphi_{ij} : U_{ij} \xrightarrow{\cong} U_{ji}$ isos \leftarrow (think "go from U_i to U_j ")

gluing conditions

- 1) $\varphi_{ii} = \text{id}$
- 2) $\varphi_{ij}(U_{ij} \cap U_{ik}) \subseteq U_{ji} \cap U_{jk}$
- 3) $\varphi_{ik} = \varphi_{jk} \circ \varphi_{ij}$ when restricted as maps $U_{ij} \cap U_{ik} \rightarrow U_k$

(case $k=i$)
 $\varphi_{ji}^{-1} = \varphi_{ij}$

Example if $U_i \subseteq X$ open subschemes, can take $U_{ij} = U_i \cap U_j \subseteq X$ with $\varphi_{ij} = \text{id}$

Claim (exercise) \exists unique (up to iso) scheme X with open cover $X = \cup X_i$:

• isos of schemes $U_i \xrightarrow[\varphi_i]{\cong} X_i$

• $U_{ij} \xrightarrow[\cong]{\varphi_i} X_i \cap X_j$
 $\varphi_{ij} \downarrow \cong \quad \downarrow \text{id}$
 $U_{ji} \xrightarrow[\varphi_j]{\cong} X_j \cap X_i$

Gluing Lemma Suppose we built X as above

$\Rightarrow f: X \rightarrow Y$ morph can be uniquely defined from morphs $f_i: X_i \rightarrow Y$ s.t.

compatibility condition:

$$\begin{array}{ccc} X_i \cap X_j & \longrightarrow & X_i & \xrightarrow{f_i} & Y \\ \text{id} \downarrow & & \downarrow & & \downarrow \\ X_j \cap X_i & \longrightarrow & X_j & \xrightarrow{f_j} & Y \end{array} \quad (*)$$

Pf Continuous map: $f: X \rightarrow Y$ defined by $f|_{X_i} = f_i$ (compatibly)

on sheaves need $f^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X \leftarrow$ (recall get $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$ by adjunction)

$(f^{-1}\mathcal{O}_Y)|_{X_i} = f|_{X_i}^{-1}\mathcal{O}_Y = f_i^{-1}\mathcal{O}_Y \leftarrow (X_i \xrightarrow{\varphi_i} X \text{ inclusion, then } \varphi_i^{-1}f^{-1}\mathcal{O}_Y = (f \circ \varphi_i)^{-1}\mathcal{O}_Y$

$f_i^\# \in \text{Mor}(\mathcal{O}_Y, (f_i)_*\mathcal{O}_{X_i}) \cong \text{Mor}(f_i^{-1}\mathcal{O}_Y, \mathcal{O}_{X_i})$ and $\mathcal{O}_{X_i} = \mathcal{O}_X|_{X_i}$ since open subs.

Finally we can glue the $f_i^\#: f_i^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X|_{X_i}$ by $(*)$ to get $f^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X$. \square

Consequence $h_Y|_{\text{Top}(X)^{\text{op}}}: \text{Top}(X)^{\text{op}} \rightarrow \text{Sets}$ is a sheaf of sets.
 $(X, Y \text{ schemes}) \quad U \longmapsto h_Y(U) = \text{Mor}(U, Y)$

4.3 Affine space by gluing (see Homework for projective space)

Affine n-space over Spec R: $\mathbb{A}_R^n = \text{Spec } R[x_1, \dots, x_n] \quad (=:\mathbb{A}_{\text{Spec } R}^n)$

Rmk $R \rightarrow S$ ring hom \Rightarrow hom on polys $\Rightarrow \mathbb{A}_S^n \rightarrow \mathbb{A}_R^n$

Example $R \rightarrow R_f \Rightarrow \mathbb{A}_{R_f}^n \rightarrow \mathbb{A}_R^n$ is the basic open set of \mathbb{A}_R^n for $f \in R \setminus \{0\}$

If $U \subseteq \text{Spec } R$ open $\Rightarrow U = \cup D_{f_i} \Rightarrow \mathbb{A}_U^n = \cup \mathbb{A}_{R_{f_i}}^n \subseteq \mathbb{A}_R^n$ (glued along $\text{Spec } R_{f_i f_j} = D_{f_i} \cap D_{f_j}$)

X scheme, affine n-space over X: $\mathbb{A}_X^n = \cup \mathbb{A}_{X_i}^n$ where $X = \cup X_i$ affine open cover

(notice $\mathbb{A}_{X_i}^n = \cup_j \mathbb{A}_{X_i \cap X_j}^n$, then identify these copies) (glued along $\mathbb{A}_{X_i \cap X_j}^n$ open in affine X_i)

Claim $\mathbb{A}^n = \text{Spec } \mathbb{Z}[x_1, \dots, x_n]$ represents functor $F: \text{Sch}^{\text{op}} \rightarrow \text{Sets}, X \mapsto \left\{ \begin{array}{l} \text{Morphs } \mathcal{O}_X^{\oplus n} \rightarrow \mathcal{O}_X \text{ s.t. } \forall U, \\ \mathcal{O}_X(U)^{\oplus n} \rightarrow \mathcal{O}_X(U) \text{ is hom of } \mathcal{O}_X(U)\text{-mod} \end{array} \right\}$

Pf $F|_{\text{Top}(X)^{\text{op}}}$ is a sheaf of sets (easy to check: can glue morphs since \mathcal{O}_X sheaf)

$h_{\mathbb{A}^n}|_{\text{Top}(X)^{\text{op}}}$ " by consequence above. Thus if the two functors agree on affines then

by sheaf property they agree everywhere. For affine $X = \text{Spec } R$ just need compare global sections

$F(\text{Spec } R) = \text{Hom}_R(R^n, R)$

$h_{\mathbb{A}^n}(\text{Spec } R) = \text{Mor}(\text{Spec } R, \mathbb{A}^n) \cong \text{Hom}(\mathbb{Z}[x_1, \dots, x_n], R)$ } in both cases just need specify where generators go $\left\{ \begin{array}{l} e_i = (0, \dots, 1, \dots, 0) \mapsto r_i \\ x_i \mapsto r_i \end{array} \right.$

5. PRODUCTS

5.0 Products in category theory

Category theory: \mathcal{C} cat., $C_i \in \mathcal{C}$

product $C_1 \times \dots \times C_n$ (if exists) is an object with morphs π_i to C_i , s.t.

coproduct $C_1 \sqcup \dots \sqcup C_n$:

← Yoneda / functor of points interpretation: \leftarrow product of sets
 $F: \mathcal{C}^{op} \rightarrow \text{Sets}, F(Z) = \prod \text{Mor}_{\mathcal{C}^{op}}(C_i, Z) = \prod h_{C_i}(Z)$
 Is it representable? if so, call the object $\prod C_i, h_{\prod C_i} \cong F = \prod h_{C_i}$
 Explicitly: $(p_i) \in \prod h_{C_i}(Z)$ gives unique $\in h_{\prod C_i}(Z) = \text{Mor}(Z, \prod C_i)$
 Why \exists maps π_j ? \exists projections of sets $h_{\prod C_i}(Z) \cong \prod h_{C_i}(Z) \rightarrow h_{C_j}(Z)$
 but $\text{Mor}(h_{\prod C_i}, h_{C_j}) \cong \text{Mor}(\prod C_i, C_j) \ni \pi_j$.

Examples Sets / Top.spaces: \times = product, π_i = projections, \sqcup = disjoint union, π_i are inclusions
 Vector spaces/abelian gps/modules: " , \sqcup = direct sum, π_i are inclusions.
 Rings: " , \sqcup = tensor product, $\pi_i(r) = 1 \otimes \dots \otimes r \otimes \dots \otimes 1$

Fix $B \in \mathcal{C}$ ("base")

Category of B-objects: \mathcal{C}/B

obj: morphs $C \rightarrow B$, morphs: in \mathcal{C}

IMPORTANT EXAMPLES:
 All schemes X have canonical $X \rightarrow \text{Spec } \mathbb{Z}$ by giving canonical maps on affines:
 $\text{Spec } R \rightarrow \text{Spec } \mathbb{Z}$ from $\mathbb{Z} \rightarrow R, 1 \mapsto 1$
 Schemes over field k means have $X \rightarrow \text{Spec } k$, same as saying all $\mathcal{O}_X(U)$ are k -algebras and restrictions are k -alg.homs

fiber product $C \times_B D$ is the product in \mathcal{C}/B of $C \xrightarrow{f} B, D \xrightarrow{g} B$ (if exists)

(or pullback, or Cartesian square)

Similarly get $C_1 \times_B \dots \times_B C_n$

← Functor of points interpretation:
 $\text{Hom}(Z, C \times_B D) \cong \text{Hom}(Z, C) \times_{\text{Hom}(Z, B)} \text{Hom}(Z, D)$
 So we are asking whether $h_C \times_{h_B} h_D$ is representable

Example for Sets or Top.spaces: $C \times_B D = \{ (c, d) \in C \times D : f(c) = g(d) \in B \}$
 for example if f, g are inclusions of subsets (subspaces) then $C \times_B D = C \cap D$

Pushout The opposite diagram (reverse arrows)

Example: for Rings the pushout of $B \rightarrow C, B \rightarrow D$ is the tensor product $C \otimes_B D$ sec. 4.2

Exercise: (co)product, fiber product, pushout are unique up to unique iso if they exist.

(Hint: compose unique maps between them (s.t. diagram commutes) then composites = id by uniqueness of self-map)

Examples of fiber products in cat. of Sets or TopSpaces: $C \times_B D = \{ (c, d) : f(c) = g(d) \} \subseteq C \times D$

$B = \text{point} \Rightarrow C \times_B D = C \times D$

$C \xrightarrow{\subseteq} B, D \xrightarrow{\subseteq} B \Rightarrow C \times_B D \cong C \cap D$

$D \xrightarrow{\subseteq} B \Rightarrow C \times_B D \cong f^{-1}(D) \subseteq C$ for example $D = \text{point} = b \in B$ get fiber $f^{-1}(b)$

$C = D \Rightarrow C \times_B D = \{ (x, y) : f(x) = g(y) \} \subseteq C \times D$ ("equaliser")

5.1 Fiber products exist in Schemes/B

Fix scheme B, consider category Schemes/B

Theorem fiber products $X_1 \times_B \dots \times_B X_n$ exist

Inductively suffices to do case $n=2$. First need some algebraic preliminaries

An A-algebra R is a ring R together with a ring hom $A \xrightarrow{\psi} R$
(A ring) $(\Rightarrow R \text{ is } A\text{-mod via } a \cdot r = \psi(a)r)$

R, S A-algebras $\Rightarrow (R \otimes_A S) = \frac{\text{free R-alg. on } R \times S}{\text{relations}}$

← (so general element is $\sum r_i \otimes s_i$
so "generators" are $r \otimes s$)

relations: $\bullet \otimes$ is bilinear

$$\bullet a \cdot (r \otimes s) = (\psi_r(a) \cdot r) \otimes s = r \otimes (\psi_s(a) \cdot s).$$

In particular $A \rightarrow R \otimes_A S$ is $a \mapsto a \cdot (1 \otimes 1) = \psi_r(a) \otimes 1 = 1 \otimes \psi_s(a)$

The product on generators: $(r \otimes s) \cdot (r' \otimes s') = rr' \otimes ss'$.

Rmk R, S rings $\Rightarrow R \otimes S = R \otimes_{\mathbb{Z}} S$

Facts

$$1) R \otimes_R S \cong S \quad (\text{via } \sum r_i \otimes s_i \mapsto \sum r_i s_i)$$

$$2) R[x_1, \dots, x_n] \otimes_R R[y_1, \dots, y_m] \cong R[x_1, \dots, x_n, y_1, \dots, y_m]$$

$$3) (S/I) \otimes_R T \cong (S \otimes_R T) / (I \otimes 1) \cdot (S \otimes_R T) \quad \text{where } S, T \text{ are } R\text{-algebras}$$

Affine case: $\text{Spec } R \times_{\text{Spec } A} \text{Spec } S = \text{Spec } (R \otimes_A S)$ exists in $\text{Aff}/\text{Spec } A$:

have pushout: $R \otimes_A S \leftarrow S$ $\xleftarrow{\psi_S} S$ $\xleftarrow{\psi_R} R$

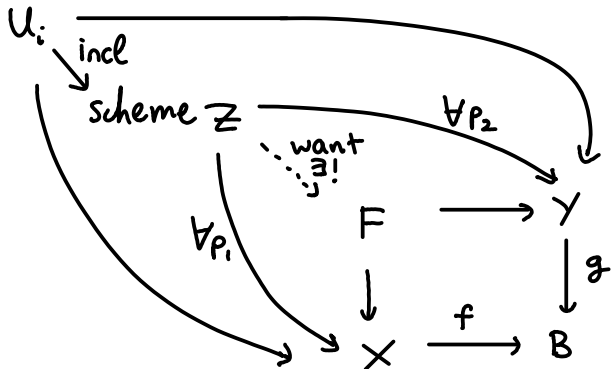

$$r \mapsto r \otimes 1 \rightarrow R \otimes_A S$$

Now apply $\text{Spec} \cdot \square$

Claim: this is fiber product also in $\text{Sch}/\text{Spec } A$:

let $X = \text{Spec } R$
 $Y = \text{Spec } S$
 $B = \text{Spec } A$
 $F = \text{Spec } (R \otimes_A S)$

affine cover:
of scheme Z

Recall fiber products are unique up to unique iso if they exist.

By construction (as U_i affine) $\exists!$ $U_i \rightarrow F$ making diagram commute

(used universal property in Aff/B)

If can show these agree on overlaps $U_{ij} = U_i \cap U_j$, then glue to unique $Z \rightarrow F$.

If U_{ij} were affine, this would have been immediate.

$U_{ij} \subseteq$ affine U_i , so running same argument with Z replaced by U_{ij} ,

we can cover U_{ij} by basic open affines $D_{f_k} \subseteq U_i$ and now $D_{f_k} \cap D_{f_l} = D_{f_k f_l}$ affine!

\Rightarrow glue uniquely to give $U_{ij} \rightarrow F$

"USEFUL TRICK" in 3.1

Recall trick that can pick open cover of U_{ij} that are basic opens simultaneously for U_i, U_j

$\Rightarrow U_{ij} \rightarrow F$ and $U_{ji} \rightarrow F$ agree.

General case build schemes/morphs by 3 gluing procedures (tedious!)

- | | |
|---|---|
| 1) case $U_i \times_B Y$ with B, Y affine, $X = \cup U_i$ affine open cover | $\Rightarrow \exists X \times_B Y$ affine |
| 2) case $X \times_B V_j$ with B affine, $Y = \cup V_j$ " " " | $\Rightarrow \exists X \times_B Y$ affine |
| 3) case $X \times_{W_k} Y$ with $B = \cup W_k$ " " " | $\Rightarrow \exists X \times_B Y$ |

Gluing works because agreement on overlaps is ensured by uniqueness up to iso of fiber products. Sketch:

preimage of open set viewed as open subscheme of U_i
(easy check by category theory)

① if know $U_i \times_B Y$ exist, then $\pi_i^{-1}(U_{ij})$ is fiber product $U_{ij} \times_B Y$ so by uniqueness \exists iso $\pi_i^{-1}(U_{ij}) \rightarrow \pi_i^{-1}(U_{ji})$, so glue & get $X \times_B Y$

② as in ①, swapping roles X, Y .

again: open subschemes since preimages of opens

③ let $X_k = f^{-1}(W_k), Y_k = g^{-1}(W_k) \Rightarrow X_k \times_{W_k} Y_k$ exists by ② (W_k affine, X_k, Y_k general)

Key trick: notice $X_k \times_{W_k} Y_k = X_k \times_B Y$
 "because images are trapped in W_k, Y_k anyway"
 Then use ① to glue the $X_k \times_B Y$. \square

Rmk Proof shows that $X \times_B Y$ has affine open cover by $\cup (U_i \times_B V_j)$ where $X = \cup U_i, Y = \cup V_j$ are " " " .

e.g. $(x-y) \in \text{Spec } \mathbb{Z}[x,y]$

Examples

1) $\mathbb{A}_R^n \times_{\text{Spec } R} \mathbb{A}_R^m = \text{Spec } R[x_1, \dots, x_n, y_1, \dots, y_m] = \mathbb{A}_R^{n+m}$

2) $\text{Spec } \mathbb{Z}/2 \times_{\text{Spec } \mathbb{Z}} \text{Spec } \mathbb{Z}/3 = \text{Spec } (\mathbb{Z}/2 \otimes_{\mathbb{Z}} \mathbb{Z}/3) = \text{Spec } (0) = \emptyset$

more points than fiber product of sets
 (0) \downarrow (0)
 (0) \mapsto (2) \neq (3)

Exercise $X \times_Y Y \cong X, X \times_B Y \cong Y \times_B X, (X \times_B Y) \times_B Z \cong X \times_B (Y \times_B Z), X \times_A B \times_B Y \cong X \times_A Y$.

5.2 Fibers and preimages

$f: X \rightarrow B$ morph of schemes

fiber over point $b \in B$: $f^{-1}(b) = \text{Spec } K(b) \times_B X$

preimage of closed subscheme $Y \subseteq B$: $f^{-1}(Y) = Y \times_B X$

Examples

$k =$ algebraically closed field \leftarrow (so classical alg. geometry)
 $f: A^1_k \rightarrow A^1_k$ induced by $f^\#: k[x] \rightarrow k[y], x \mapsto y^2$
fiber over 0: (view point 0 as $\text{Spec } k \rightarrow A^1_k$ so $k \cong k[x]/(x)$)
 fiber = $\text{Spec } k \times_{\text{Spec } k[x]} A^1_k = \text{Spec}(k \otimes_{k[x]} k[y])$
 $= \text{Spec } k[y]/(y^2) \leftarrow$ (so can't avoid schemes) \leftarrow where $f^*(x) = y^2$

4) Mumford's picture of $\text{Spec } \mathbb{Z}[x]$:

π is induced by inclusion $\mathbb{Z} \rightarrow \mathbb{Z}[x]$
 $\Rightarrow \pi^{-1}((p)) = V((p)) = \{(p), (p, f(x)) : f(x) \text{ mod } p \text{ is irreducible in } \mathbb{F}_p[x]\}$
 (so (p) is a dense point in $\pi^{-1}((p))$) \leftarrow (if $p \in \mathbb{I}$ then $\mathbb{Z}[x]/\mathbb{I} \cong \mathbb{F}_p[x]/\mathbb{I}$ where $\mathbb{F}_p = \mathbb{Z}/p$ PID, so (f) prime $\Leftrightarrow f$ irred or 0)

Rmk curve $V(x^2+1)$ passes through $(p, x+j)$ iff x^2+1 vanishes at that point, so iff $x^2+1=0$ in $\mathbb{F}_p[x]/(x+j) \cong \mathbb{F}_p, x \mapsto -j$, so iff $j^2 = -1$.
 Classical number theory says a square root of -1 exists in $\mathbb{F}_p \Leftrightarrow (p=1 \text{ mod } 4 \text{ or } p=2)$

fiber over (p): $K(p) = \mathbb{Z}_{(p)}/p \cdot \mathbb{Z}_{(p)} = (\mathbb{Z}/p)_{(p)} = \mathbb{F}_p = \mathbb{Z}/p$
 $\Rightarrow \pi^{-1}(p) = \text{Spec}(K(p) \otimes_{\mathbb{Z}} \mathbb{Z}[x]) = \text{Spec } \mathbb{F}_p[x] = \{(0), (f(x))\}$ (irred in $\mathbb{F}_p[x]$ nonconstant)

fiber over (0): $K(0) = \mathbb{Z}_{(0)} = \mathbb{Q}$
 $\Rightarrow \pi^{-1}(0) = \text{Spec}(K(0) \otimes_{\mathbb{Z}} \mathbb{Z}[x]) = \text{Spec } \mathbb{Q}[x] = \{(0), (f(x))\}$
 [Gauss's Lemma: for $f \in \mathbb{Z}[x]$ primitive (gcd(coeffs)=1) f irred. $\in \mathbb{Z}[x] \Leftrightarrow f$ irred. $\in \mathbb{Q}[x]$] \leftarrow (irred in $\mathbb{Q}[x]$ nonconstant) so WLOG irred in $\mathbb{Z}[x]$, nonconstant

Consequence $\text{Spec } \mathbb{Z}[x] = \{(0), (p), (f), (p, f^*)\}$ \leftarrow $f \in \mathbb{Z}[x]$ irred. mod p nonconstant
 \leftarrow $p \in \mathbb{Z}$ prime \leftarrow $f \in \mathbb{Z}[x]$ irred, nonconstant

Forgetful functor $|\cdot|: \text{Sch} \rightarrow \text{TopSpaces}$, $X \mapsto |X| = \text{underlying topological space}$,
 $\text{morph} \mapsto \text{underlying continuous map}$

Claim $f: X \rightarrow B$ morph schemes $\Rightarrow |f^{-1}(b)| = |f|^{-1}(b)$

← fiber is homeomorphic to topological fiber

Pf WLOG B affine = $\text{Spec } S$ and b is prime ideal $p \subseteq S$

$f^{-1}(B) = \cup \text{Spec } R_i$ given by $\varphi_i: S \rightarrow R_i$

WLOG just consider one affine, so $R = R_i$, so WLOG $X = \text{Spec } R$

$$\Rightarrow \text{Spec } k(b) \times_B X = \text{Spec } (k(b) \otimes_S R)$$

$$k(b) = (S/p)_p \Rightarrow k(b) \otimes_S R = (S/p)_p \otimes_S R = S_p \otimes_S S/p \otimes R = S_p \otimes_S R / \varphi(p)R = R_{\varphi(p)} / \varphi(p) \cdot R_{\varphi(p)}$$

$$\Rightarrow \text{Spec } (k(b) \otimes_S R) \xleftarrow{|\cdot|} \left\{ \begin{array}{l} q \subseteq R \text{ prime ideal containing } \varphi(p) \text{ but not intersecting } \varphi(S \setminus p) \\ q \cdot R_p \leftrightarrow q \quad (= \text{preimage of } qR_p \text{ via localisation } R \rightarrow R_p = S_p \otimes_S R) \end{array} \right\}$$

$$q \subseteq R \setminus \varphi(S \setminus p) \Rightarrow \varphi^{-1}q \subseteq S \setminus (S \setminus p) = p \quad \uparrow \varphi q = p$$

$$q \supseteq \varphi(p) \Rightarrow \varphi^{-1}q \supseteq p \quad \uparrow \varphi q = p$$

Cor Given $f: X \rightarrow B$, $g: Y \rightarrow B$,

fiber of $|X \times_B Y| \rightarrow |X| \times_{|B|} |Y|$ over (x, y) is $\left| \text{Spec } \left(\begin{array}{c} k(x) \otimes_{k(b)} k(y) \\ k(b) \end{array} \right) \right|$
 ← where $f(x) = g(y) = b$

Pf fiber of $X \times_B Y \rightarrow X$ over x : $\text{Spec } k(x) \times_X (X \times_B Y) = \text{Spec } k(x) \times_B Y$

fiber of $\text{Spec } k(x) \times_B Y \rightarrow Y$ over y : $\text{Spec } k(x) \times_B Y \times_Y \text{Spec } k(y) = \text{Spec } k(x) \times_B \text{Spec } k(y)$

fiber of $\text{Spec } k(x) \times_B \text{Spec } k(y) \rightarrow B$ over b : $\text{Spec } k(x) \times_{\text{Spec } k(b)} \text{Spec } k(y) = \text{Spec } k(x) \otimes_{k(b)} k(y)$.
 lands in $\{b\} \subseteq B$ □

<p>at algebra level: if A_1, A_2 are modules over $S = R_p/pR_p$ then</p> $S \otimes_R (A_1 \otimes_R A_2) \cong A_1 \otimes_S A_2$ <p>namely:</p> $\frac{r}{t} \otimes a_1 \otimes a_2 \mapsto \frac{r}{t} \cdot (a_1 \otimes a_2)$	<p>or at category level, with abuse of notation:</p>
--	--

Warning $|X \times Y| \neq |X| \times |Y|$ in general, e.g. $\text{Spec } \mathbb{Z}_2 \times \text{Spec } \mathbb{Z}_3 = \emptyset$

e.g. $\mathbb{A}_{\mathbb{Z}}^2 = \mathbb{A}_{\mathbb{Z}}^1 \times \mathbb{A}_{\mathbb{Z}}^1 = \text{Spec } \mathbb{Z}[x, y]$ then $(x+y) \mapsto (0)$ via both projections but $(x+y) \neq (0)$

Rmk If x, y closed points of schemes X, Y over k , and k algebraically closed, then fiber over (x, y) of $X \times_{\text{Spec } k} Y$ is $\text{Spec } (k(x) \otimes_k k(y)) = \text{Spec } (k \otimes_k k) = \text{Spec } k = (0)$ so over closed points you get the product of sets. ← (so classical alg. geom.)

Warning $\mathbb{A}_k^2 = \mathbb{A}_k^1 \times \mathbb{A}_k^1$ does not have the product topology, e.g. consider $\mathbb{V}(x-y)$

Non-examinable Rmk Working over an algebraically closed field k , the stalk of $X \times_{\text{Spec } k} Y$ at (x, y) is $\mathcal{O}_{X, x} \otimes_k \mathcal{O}_{Y, y}$ localised at max ideal $\mathfrak{m}_{x, x} \otimes \mathfrak{m}_{y, y} + \mathcal{O}_{X, x} \otimes \mathfrak{m}_{y, y}$

5.3 Base change $X_A := X \times_B A \rightarrow X$ is base-change of $X \rightarrow B$ to A

all schemes \rightarrow

$$\begin{array}{ccc} X & \longrightarrow & B \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

Example $\mathbb{A}_X^n = \mathbb{A}_{\mathbb{Z}}^n \times_{\text{Spec } \mathbb{Z}} X$ is base change of $\mathbb{A}_{\mathbb{Z}}^n$ to X via $X \rightarrow \text{Spec } \mathbb{Z}$

Motivation This generalises the idea of changing the "base coefficients"

example: $X = \text{Spec } \mathbb{R}[x_1, \dots, x_n]/(f_1, \dots, f_n)$ real affine variety $\subseteq \mathbb{R}^n$

$B = \text{Spec } \mathbb{R}$
 $A = \text{Spec } \mathbb{C}$ } and $A \rightarrow B$ via $\varphi: \mathbb{R} \rightarrow \mathbb{C}$ inclusion

$X \times_B A$ is Spec of: $\frac{\mathbb{R}[x_1, \dots, x_n]}{(f_1, \dots, f_n)} \otimes_{\mathbb{R}} \mathbb{C} \cong \frac{\mathbb{C}[x_1, \dots, x_n]}{(\varphi(f_1), \dots, \varphi(f_n))}$ so affine var $\subseteq \mathbb{C}^n$
 (same polys but viewed over \mathbb{C})

Same works if replace $\mathbb{R} \rightarrow \mathbb{C}$ by any ring hom $S \rightarrow R$.

FACT Many properties of $A \rightarrow B$ are inherited by the base change $X_A \rightarrow X$:

- ① affine, ② quasi-compact, ③ locally finite type, ④ finite type, ⑤/⑥ closed/open immersion, ⑦ flat as well as properties from 5.3: ⑧ separated, ⑨ universally closed, ⑩ proper

5.3 More properties of schemes (all properties we list are preserved when compose such morphs)

Motivation Topological space X is Hausdorff \iff diagonal $\Delta = \{(x, x) : x \in X\} \subseteq X \times X$ closed

⑧ $f: X \rightarrow B$ morph of schemes is separated if

$\Delta = \Delta_{X/B}: X \rightarrow X \times_B X$ is a closed immersion.

$\iff \forall \exists$ open cover U_i of B , $f^{-1}(U_i) \rightarrow U_i$ separated

(HWK 3: enough to check image is a closed set)

Rmk often write Δ to mean image $\subseteq X \times_B X$ of morphism Δ .

Rmk Any subscheme $S \subseteq X$ over B is also separated since $\Delta_{S/B} = \Delta_{X/B} \cap (S \times_B S)$

Rmk X separated means separated over $\text{Spec } \mathbb{Z}$ so $\Delta \subseteq X \times X$ closed

Example for affine varieties (similar for projective varieties) work over $B = \text{Spec } k$:

$\text{Spec } k[X] \times_k \text{Spec } k[X] = \text{Spec } k[X] \otimes_k k[X] \supseteq \Delta$ has ideal $\langle f \otimes 1 - 1 \otimes f : f \in k[X] \rangle$ ← see next claim

Why good? It disallows pathologies like "affine line with two origins" (Hwk 1 ex. 5) arising by gluing $\text{Spec } \mathbb{R}[s, s^{-1}] \hookrightarrow \text{Spec } \mathbb{R}[x]$ by $x \mapsto s$ (if do $x \mapsto s^{-1}$ then get $\mathbb{P}_{\mathbb{R}}^1$: Hwk. 2, ex 1)

Claim Affine opens are separated

Pf $\Delta: \text{Spec } R \rightarrow \text{Spec } R \times R$ comes from $R \otimes R \xrightarrow{m} R$,

surjective: $m(r, 1) = r$ (and $\ker = \langle r \otimes 1 - 1 \otimes r : r \in R \rangle$). \square

Claim X separated $\iff \forall$ affine opens U, U_2 ← multiply restrictions
 (enough if holds for cover U_i):
 i) $U_1 \cap U_2$ affine
 ii) $\Gamma(U_1, \mathcal{O}_X) \otimes \Gamma(U_2, \mathcal{O}_X) \xrightarrow{\text{surj}} \Gamma(U_1 \cap U_2, \mathcal{O}_X)$

Pf $\Rightarrow U_1 \cap U_2 \cong (U_1 \times U_2) \cap \Delta$, so $U_1 \cap U_2 \subseteq U_1$ closed inside affine so affine.

U_i affine $\Rightarrow \Gamma(U_1) \otimes \Gamma(U_2) \cong \Gamma(U_1 \times U_2)$, by (i) $U_1 \times U_2 = \text{Spec } A$ say

$\Rightarrow U_1 \cap U_2 \cong (U_1 \times U_2) \cap A = \text{Spec } A/I$ some $I \subseteq A$, so $\Gamma(U_1 \times U_2) \rightarrow \Gamma(U_1 \cap U_2)$

\Leftarrow Cover $X \times X = \cup U_i \times U_j$ by products of affine opens. $A \twoheadrightarrow A/I$

$\Gamma(U_1 \times U_2) \cong \Gamma(U_1) \otimes \Gamma(U_2) \xrightarrow{\text{surj}} \Gamma(U_1 \cap U_2)$ so $\Delta^{-1}(U_i \times U_j) \cong U_i \cap U_j \subseteq X$ closed ← its ideal is ker of hom (ii)
 So Δ closed immersion (use 3rd definition in ⑤ Sec. 3.6)

HWK 3 Claim holds also in case $\Delta_{X/B}$, after tweaking conditions slightly.

Claim X separated $\Leftrightarrow \forall \varphi_1, \varphi_2 : Y \rightarrow X$ if $\varphi_1 = \varphi_2$ on dense subset \leftarrow "equalizers are closed"
 then $\varphi_1 = \varphi_2$ as topological maps (so if Y reduced then $\varphi_1 = \varphi_2$ as morphisms)

Pf $\Rightarrow \varphi_1 \times \varphi_2 : Y \rightarrow X \times X, (\varphi_1 \times \varphi_2)^{-1}(\Delta) \subseteq Y$ is closed & dense so $= Y$. \leftarrow see 3.3

$\Leftarrow Y = \overline{\Delta \cap (U_i \times U_j)}, \varphi_1, \varphi_2 : Y \rightarrow X$ projections $\Rightarrow \varphi_1 = \varphi_2$ is precisely the set $\Delta \cap (U_i \times U_j)$.

Claim $X \xrightarrow{f} Y, Y$ separated \Rightarrow graph $\Gamma_f : X \rightarrow X \times Y$ closed imm.

Pf $\text{id} \times f : Y \times X \rightarrow Y \times Y, \Gamma_f \cong (\text{id} \times f)^{-1} \Delta$ closed \square \leftarrow Non-examinable Rmk: Can also view this as a base change

⑨ Motivation For top. spaces, X compact $\Leftrightarrow (\forall Y, X \times Y$ is closed map i.e. sends closed sets to closed sets)

$f : X \rightarrow B$ universally closed: $X_y = X \times_B Y \rightarrow X$
 \forall base extension is closed map $\rightarrow \downarrow$ \forall $\downarrow f$ is closed map

Fact f univ. closed $\Rightarrow f$ quasi-compact. $Y \xrightarrow{\Delta} B$

⑩ $f : X \rightarrow B$ proper \Leftrightarrow ④, ⑧, ⑨ (finite type, separated and universally closed)

Motivation Analogue in smooth world is "preimages of compact sets are compact"

Example Projective n-space $\mathbb{P}_B^n = \mathbb{P}_Z^n \times B$ (build \mathbb{P}_Z^n by gluing in Hwk 2)

$f : X \rightarrow Y$ is a projective morphism if factors

$X \xrightarrow{\text{closed immersion}} \mathbb{P}_Y^n \xrightarrow{\text{projection}} Y$

Fact if X, Y Noetherian this is proper.

5.4 Varieties \leftarrow or abstract variety

Def A variety is a scheme over k

- s.t.
- (i) integral
 - (ii) $X \rightarrow \text{Spec } k$ finite type ④
 - (iii) $X \rightarrow \text{Spec } k$ separated ⑧

(i) $\Leftrightarrow X$ irreducible, $\mathcal{O}_X(U)$ reduced \leftarrow Sometimes don't require irreducibility, just require reduced. But can study one irreducible component at a time.

(ii) $\Leftrightarrow X$ quasi-compact, $\mathcal{O}_X(U)$ are f.g. k -algebras

The definition includes all quasi-projective varieties from classical algebraic geom.

but \exists more: Nagata (1956) \exists variety can't embed into any \mathbb{P}_k^n (Rmk finite union of quasi-compacts is quasi-compact)

You get varieties by gluing together finitely many affine varieties along common open sets (the separated assumption prevents pathologies, see ⑧)

A variety is complete if $X \rightarrow \text{Spec } k$ proper ⑩, so extra condition: (iv) universally closed ⑨

Motivation Over \mathbb{C} for "holomorphic spaces" you ask whether a holomorphic map $D^* \rightarrow X$ on the punctured disc, meromorphic at 0, can be extended to a holomorphic map $D \rightarrow X$ i.e. there are no "missing points in X ". (Made rigorous by "valuative criterion for properness")

Hwk 3: \blacksquare integral closed subsch. of variety is variety \leftarrow exclude e.g. irred. closed subsch. $\text{Spec}(k[x]/(x^2)) \subseteq \mathbb{A}_k^1$
 \square irreducible open subsch. of variety is variety

Examples Complete Varieties: \mathbb{P}_k^n , projective varieties ($\blacksquare \subseteq \mathbb{P}_k^n$), Nagata's 1956 example

Varieties: \mathbb{A}_k^n , affine varieties ($\blacksquare \subseteq \mathbb{A}_k^n$), quasi-projective varieties ($\square \subseteq \text{proj. variety}$)

\leftarrow not complete (except point, \emptyset) \leftarrow (uses that k is alg. closed)

Rmk A point $x \in X$ of a variety is closed $\Leftrightarrow K(x) \cong k$. E.g. $\mathbb{A}_k^1 = \text{Spec } k[x], K((x-a)) \cong k, K((0)) = k(x)$

5.5 Scheme structure on subsets

Claim Any closed subset $C \subseteq X$ of a scheme $\Rightarrow \exists!$ closed reduced subscheme $(C, \mathcal{O}_C) \rightarrow X$

Pf $\mathcal{J}(U) := \{s \in \mathcal{O}_X(U) : s(p) = 0 \in K(p) \forall p \in C \cap U\}$ is sheaf of ideals

Locally: $U = \text{Spec } R, C \cap U = \mathbb{V}(I)$ for unique radical ideal I

then $s(p) = 0 \in K(p) = (R/p)_p \forall p \in \mathbb{V}(I) \Leftrightarrow s \in \bigcap_{p \in \mathbb{V}(I)} P = \sqrt{I} = I \Rightarrow \mathcal{J}(\text{Spec } R) = I$

Same trick shows $\mathcal{J}(D_f) = I_f$, so \mathcal{J} is the quasi-coherent ideal sheaf corresponding to I

Note: $C = \text{supp}(\mathcal{O}_X/\mathcal{J})$ and $C \cap U = \text{Spec } R/I$, and we define $\mathcal{O}_C = \mathcal{O}_X/\mathcal{J}$. \square

Def call this the "induced reduced scheme structure" on C .

(so sheafify $C \cap U \mapsto \mathcal{O}_X(U)/\mathcal{J}(U)$)

Example When we consider an irreducible component $Z \subseteq X$, we use this scheme structure

Exercise For $C = X \subseteq X$ get the reduced scheme X_{red} (see ⑤ in Sec. 3.6)

Def $Z \subseteq X$ locally closed means $\forall z \in Z, \exists$ open $z \in U$ s.t. $Z \cap U$ is closed in U .

(i.e. \exists closed C with $Z \cap U = C \cap U$)

Lemma Z locally closed $\Leftrightarrow Z$ open in \bar{Z} (i.e. $Z = \bar{Z} \cap U$ some open $U \subseteq X$) \leftarrow by Lemma, $C = \bar{Z}$ works

Pf \Leftarrow : $Z = \bar{Z} \cap U$ for open $U \subseteq X \Rightarrow Z \cap U = Z = \bar{Z} \cap U$

\Rightarrow : $Z \cap U$ closed in U so equals its closure in U which is: $\text{Cl}_U(Z \cap U) = \bar{Z} \cap U$.

$\Rightarrow z \in Z \cap U = \bar{Z} \cap U \subseteq \bar{Z}$ so Z contains an open neighbourhood of z in \bar{Z} \square

Rmk $\bar{Z} \subseteq X$ closed, so $\exists!$ induced reduced scheme structure $\mathcal{O}_{\bar{Z}}$ on \bar{Z}

$Z \subseteq \bar{Z}$ is open so get " " " $\mathcal{O}_Z = \mathcal{O}_{\bar{Z}}|_Z$ (so $\mathcal{O}_Z(V) = \mathcal{O}_{\bar{Z}}(V)$)

The local description is the same as above: $Z \cap U = \bar{Z} \cap U = \text{Spec}(R/I), \mathcal{O}_Z|_U \cong \mathcal{O}_{\text{Spec}(R/I)}$

Rmk If Z irreducible ($\Rightarrow \bar{Z}$ irreducible) then $I = p \in \text{Spec } R$ where p is a generic point for both Z, \bar{Z}

Hwk 3 Z irred. locally closed \subseteq variety $(X, \mathcal{O}_X) \Rightarrow (Z, \mathcal{O}_Z)$ variety

Hwk 3 (X, \mathcal{O}_X) variety, $Z \subseteq X$ irreducible subspace \leftarrow (the irreducibility is not so important if allow varieties to be reducible)

Define sheaf \mathcal{O}_Z on Z : for open $V \subseteq Z$,

$$\mathcal{O}_Z(V) = \left\{ s: V \rightarrow \bigsqcup_{x \in V} K(x) : \forall x \in V \exists \text{ open } x \in U \subseteq X, t \in \Gamma(U, \mathcal{O}_X) \right. \\ \left. \text{such that } s(x) = t(x) \in K(x), \forall x \in V \cap U \right\}$$

Prove that:

(Z, \mathcal{O}_Z) variety $\Rightarrow Z$ locally closed and \mathcal{O}_Z is the induced reduced scheme structure

(universal property for the above sheaf)

Lemma With that definition, if Y reduced scheme, $f: Y \rightarrow X$ morph of sch.

if $f(Y) \subseteq Z$ (as topological spaces) then f factorizes $f: Y \rightarrow Z \rightarrow X$

Pf Need check sheaves: $s \in \mathcal{O}_Z(U \cap Z)$ for $U \subseteq X$ open then \exists open

cover $U \cap Z = \cup U_i \cap Z$ and $t_i \in \mathcal{O}_X(U_i), s(x) = s_i(x) \in K(x) \forall x \in U_i \cap Z$

$\Rightarrow f^*(s_i) \in \mathcal{O}_Y(f^{-1}U_i), f^*(s_i)(y) = f^*(s_j)(y) \forall y \in f^{-1}(U_i \cap U_j)$

\Rightarrow by Sec. 3.3 since Y reduced: $f^*(s_i)_y = f^*(s_j)_y \in \mathcal{O}_{Y,y} \forall y \in f^{-1}(U_i \cap U_j)$

$\Rightarrow f^*(s_i)$ glue to a unique section $r \in \mathcal{O}_Y(f^{-1}U)$. Define $\mathcal{O}_Z(U) \rightarrow \mathcal{O}_Y(f^{-1}U), s \mapsto r$

and note $\mathcal{O}_X(U_i) \rightarrow \mathcal{O}_Z(U_i \cap Z) \rightarrow \mathcal{O}_Y(f^{-1}U_i), s_i \mapsto s|_{U_i \cap Z} \mapsto r|_{f^{-1}U_i} \square$

Rmk Applying Lemma to the case $Y =$ locally closed $Z \subseteq X$ with induced reduced sheaf will show $\mathcal{O}_Y \cong \mathcal{O}_Z$

Z has unique generic point p (see 3.4) so $Z \subseteq \bar{p} \subseteq \bar{Z}$ so $\bar{p} = \bar{Z}$

Idea: We ensure functions on Z are locally restrictions of local functions of X , in classical sense of k -valued functions, rather than germs (recall $K(x) \cong k$ if Z is closed point, k alg. closed)

Non-examinable Pf

6. SHEAVES OF MODULES

6.1 \mathcal{O}_X -modules

Def \mathcal{O}_X -module is : • sheaf $F \in \text{Ab}(X)$
 (or sheaf of/in \mathcal{O}_X -mods) • $F(U)$ is an $\mathcal{O}_X(U)$ -module
 • restrictions are compatible with module structure

EXAMPLE:
 $F = \bigoplus_{i \in I} \mathcal{O}_X$
 free \mathcal{O}_X -mod

(X, \mathcal{O}_X) ringed space

Morphism $F \rightarrow G$ of \mathcal{O}_X -module is : • morph $F \xrightarrow{\varphi} G$ of sheaves

(if monomorph, i.e. φ_U injective, F is \mathcal{O}_X -submod of G) • $F(U) \xrightarrow{\varphi_U} G(U)$ is hom of $\mathcal{O}_X(U)$ -mods

Rmk stalk F_x is $\mathcal{O}_{X,x}$ -mod, and for morphs $F \rightarrow G$ get $F_x \rightarrow G_x$ is $\mathcal{O}_{X,x}$ -mod hom.

Example A sheaf of ideals is an \mathcal{O}_X -submod of \mathcal{O}_X ← (just like R -submods of R are ideals)

Fact $\mathcal{O}_X\text{-Mods} = (\text{category of } \mathcal{O}_X\text{-mods on } X)$ is an abelian cat ← (proof similar to $\text{Ab}(X)$ abelian)

or: $\text{Mod}_{\mathcal{O}_X}(X)$

Indeed notions of submod, quotient mod, ker, coker, Im agree with what get in $\text{Ab}(X)$
 e.g. $F \rightarrow G \rightarrow H$ exact \iff exact in $\text{Ab}(X)$ \iff exact on stalks

Will write $\text{Hom}_{\mathcal{O}_X}$ for morphisms in this category.

6.2 Modules generated by sections

$\text{Hom}_{\mathcal{O}_X}(\mathcal{O}_X, F) \xrightarrow{\cong} F(X) \quad \forall F \in \mathcal{O}_X\text{-Mods}$ ← analogue of $\text{Hom}_R(R, M) \cong M$
 $\varphi \mapsto \varphi(1)$

$(\varphi: \mathcal{O}_X \rightarrow F) \longleftrightarrow s = \varphi(1)$ since $\varphi_U(r) = \varphi_U(r \cdot 1) = r \cdot s|_U \quad \forall r \in \mathcal{O}_X(U)$

Similarly $\text{Hom}_{\mathcal{O}_X}(\mathcal{O}_X^{\oplus n}, F) \xrightarrow{\cong} F(X)^{\oplus n}$ defined by n global sections $s_1, \dots, s_n \in F(X)$

Def F is generated by global sections if

\exists surjection $\bigoplus_{i \in I} \mathcal{O}_X \rightarrow F$ of \mathcal{O}_X -mods ($\iff s_i|_x$ generate $\mathcal{O}_{X,x}$ -mod $F_x \quad \forall x \in X$)
 same as picking sections $s_i \in F(X)$ (as \mathcal{O}_U -module, $\bigoplus \mathcal{O}_U \rightarrow F|_U$)

Def F is locally generated by sections if $\forall x \in X \exists$ open $x \in U$ s.t. $F|_U$ generated by global sections

Rmk Can produce \mathcal{O}_X -submods from given local sections $s_i \in F(U_i)$ ← sheafify $U \rightarrow$ possible $\mathcal{O}_X(U)$ -linear combos of $(s_i|_U : U \subseteq U_i)$

Def A sheaf has finite type if locally generated by finitely many sections.

6.3 Vector bundles and coherent modules

Def \mathcal{O}_X -mod F is locally free \mathcal{O}_X -mod of finite rank ("or" vector bundle) if

$\forall x \in X \exists$ open $x \in U : F|_U \cong \mathcal{O}_U^{\oplus n}$ ← (rank n can depend on U unless we say "of rank n ")
 as \mathcal{O}_U -mods

so $\mathcal{O}_U^{\oplus n} \rightarrow F|_U$
 some open $x \in U$
 some $n \in \mathbb{N}$
 (not fixed)

i.e. locally generated by finite # of "independent sections"

Def X invertible sheaf ("or" line bundle) if $n=1$ (fixed)

(X, \mathcal{O}_X) locally ringed space

(as $\mathcal{O}_{X,x}$ -mods)

locally $\mathcal{O}_U \xrightarrow{\cong} \mathcal{O}_U \cdot s = F|_U$
 generated by one section $s \in F(U)$

Question Is it enough to ask $F_x \cong \mathcal{O}_{X,x}^{\oplus n} \quad \forall x$ some $n \in \mathbb{N}$ depending on x ?

clearly \implies , for \Leftarrow just pick generators $s_1, \dots, s_n \in F_x$, so $s_i \in F(U_i)$ some open $x \in U$;

WLOG same U (take $\cap U_i$) get $\mathcal{O}_U^{\oplus n} \rightarrow F|_U$ which is surj. at x , so surjective possibly after shrinking U . But is it injective? (Would need to know inj. $\forall y \in U$)
 not just at x

recall for Coker we sheafify, so epimorph is not quite same as surj. $\forall U$ see Hwk. 4

Def $F \in \mathcal{O}_X\text{-Mods}$ is coherent if

F finite type and $\text{Ker}(\mathcal{O}_U^{\oplus n} \rightarrow F|_U)$ finite type
 $\forall \mathcal{O}_U$ -mod homs, \forall open $U, \forall n \in \mathbb{N}$

$\text{Vect}(X) = \{\text{vector bundles on } X\} \subseteq \mathcal{O}_X\text{-Mods}$, but not an abelian cat (Ker, Coker need not be free)
 $\text{Coh}(X) = \{\text{coherent } \mathcal{O}_X\text{-mods}\} \leftarrow$ Fact abelian category! (explains partly its importance)

Claim $F \in \text{Coh}(X)$ and $F_x \cong \mathcal{O}_{x,x}^{\oplus n} \implies F \in \text{Vect}(X)$ ($\forall x \in X$, some $n \in \mathbb{N}$ depending on x unless we fix the rank)

Pf Above got $\mathcal{O}_U^{\oplus n} \xrightarrow{\psi} F|_U$
 $\text{Ker } \psi$ finite type \implies possibly after shrinking U , get exact sequence
 $\mathcal{O}_U^{\oplus m} \xrightarrow{\psi} \mathcal{O}_U^{\oplus n} \xrightarrow{\varphi} F|_U \rightarrow 0$ \leftarrow such F are called locally finitely presented

$(\text{Ker } \varphi)_x = 0$ by construction so $0 \rightarrow \text{Ker } \varphi$ surjective at x , therefore after shrinking U further m times can assume $\psi(e_i) \in \text{Ker } \varphi_U$ is in image of $0|_U \rightarrow \text{Ker } \varphi_U$, hence $\psi(e_i) = 0$, so $\psi = 0$, so φ iso. \square \leftarrow 1 in i -th copy of \mathcal{O}_U in $\mathcal{O}_U^{\oplus m}$
 \leftarrow notice how finiteness of m also played a role.

Rmk $F \in \text{Coh}(X) \implies F$ locally finitely presented
Pf $\mathcal{O}_U^{\oplus n} \rightarrow F|_U$ then consider Ker . \square

Converse of Claim?
Cor X locally Noetherian scheme $\implies \text{Vect}(X) = \{F \in \text{Coh } X : \forall x, F_{x,x} \cong \mathcal{O}_{x,x}^{\oplus n} \text{ some } n\} \subseteq \text{Coh}(X)$

Pf $F \in \text{Vect}(X) \implies F$ finite type, in general
 $\text{Ker}(\mathcal{O}_U^{\oplus n} \xrightarrow{\varphi} F|_U)$ (need show finite type) shrinking U WLOG U affine = $\text{Spec } R$ \leftarrow Noetherian

In sections below we will prove that because $\mathcal{O}_U^{\oplus n}, F|_U$ are "quasi-coherent" the problem reduces to taking global sections: $\text{Ker}(R^n \xrightarrow{\varphi} F(U))$ and this is finitely generated since R Noeth (so get exact sequence $R^m \rightarrow R^n \xrightarrow{\varphi} F(U) \rightarrow 0$ and this will imply $\mathcal{O}_U^{\oplus m} \rightarrow \mathcal{O}_U^{\oplus n} \xrightarrow{\varphi} F \rightarrow 0$ exact). \square

6.4 \mathcal{O}_X -module \tilde{M} on $X = \text{Spec } R$, for R -mod M

sheaf \tilde{M} on $X = \text{Spec } R$ by Sec. 1.12 method:
 • $\tilde{M}(D_f) = M_f$ (so $\tilde{M}(X) = \tilde{M}(D_1) = M$)
 • $D_g \subseteq D_f \implies M_f \rightarrow M_g$ induced by $R_f \rightarrow R_g$
 • stalk $\tilde{M}_p = \varinjlim_{D_f \ni p} \tilde{M}(D_f) = \varinjlim_{D_f \ni p} M_f \cong M_p$ $\leftarrow (\varinjlim M \otimes R_f \cong M \otimes \varinjlim R_f \cong M \otimes R_p$
 • $\tilde{M}(U) = \{s: U \rightarrow \coprod_{p \in \text{Spec } R} M_p : s(p) \in M_p \text{ which are locally compatible:}$
 $\forall p \in U, \exists \text{ open nbhd } p \in D_f \subseteq U \text{ with } s(x) = t_x$
 $\exists t \in \tilde{M}(D_f) \cong M_f$ \leftarrow some $f \in R$ $\forall x \in D_f \parallel \tilde{M}_x \cong M_x / f$

with the obvious restriction maps.
Rmk could assume $t = \frac{m}{f}$ since can replace D_f with D_{fm} ($= D_f$).
 • could just ask $s(x) = t_x$ on a smaller open $p \in V \subseteq D_f$.
 \leftarrow is image via natural $M_f \rightarrow M_x$

$\tilde{M} = \text{sheafification of } U \mapsto M \otimes_R \mathcal{O}_X(U)$

call \tilde{M} the sheaf associated to M
UPSHOT \tilde{M} is \mathcal{O}_X -module on $X = \text{Spec } R$

$\varphi: M \rightarrow N$ R -mod hom $\implies \tilde{M} \rightarrow \tilde{N}$ \mathcal{O}_X -mod morph by gluing $\tilde{M}(D_f) \rightarrow \tilde{N}(D_f)$
 (just need check stalks, then use sec. 3.0) \leftarrow for converse take global sections

\implies fully faithful exact functor $R\text{-Mods} \rightarrow \mathcal{O}_{\text{Spec}(R)}\text{-Mods}$

EXAMPLES. $\tilde{R} = \mathcal{O}_X$ ($X = \text{Spec } R$)
 • $\bigoplus_{i \in I} M_i \cong \bigoplus_{i \in I} \tilde{M}_i$, so $\bigoplus_{i \in I} \tilde{R} \cong \bigoplus_{i \in I} \mathcal{O}_X$

$M \otimes R_f \xrightarrow{\varphi \otimes \text{id}} N \otimes R_f$

6.5 Direct image and inverse image

$(f_*F)(U) = F(f^{-1}(U))$ is $\mathcal{O}_X(f^{-1}(U))$ -mod $\cong f_*\mathcal{O}_X(U)$
 Example $\alpha: \text{Spec } S \rightarrow \text{Spec } R, \varphi = \alpha^\#: R \rightarrow S$
 N S -mod $\Rightarrow \alpha_*\tilde{N} = \tilde{R}N$ $\leftarrow R^N = N$ viewed as R -mod via φ
 Pf $(\alpha_*\tilde{N})(D_f) = \tilde{N}(D_{\varphi f}) = N_{\varphi f} = (R^N)_f$ compatible with restrictions \square

Algebra: Recall $R \xrightarrow{\varphi} S$ hom of rings, then S is R -mod via $r \cdot s = \varphi(r)s$.

$f: X \rightarrow Y$ morph of ringed spaces, then:

$f^{-1}\mathcal{O}_Y(U) \rightarrow \mathcal{O}_X(U)$ makes \mathcal{O}_X an $f^{-1}\mathcal{O}_Y$ -mod on ringed space $(X, f^{-1}\mathcal{O}_Y)$

$(f^{-1}F)(U) = \varinjlim_{V \supseteq fU} F(V)$ \leftarrow act by $\mathcal{O}_Y(V)$
 so can act by $(f^{-1}\mathcal{O}_Y)(U) = \varinjlim_{V \supseteq fU} \mathcal{O}_Y(V)$

6.6 Operations on \mathcal{O}_X -mods

$\text{Hom}_{\mathcal{O}_X}(F, G): U \mapsto \text{Hom}_{\mathcal{O}_X(U)}(F(U), G(U))$ is a sheaf of \mathcal{O}_X -mods.

coproduct in \mathcal{O}_X -Mod: F_i \mathcal{O}_X -mods, $\bigoplus F_i = \text{sheafify}(U \rightarrow \bigoplus F_i(U))$

Fact \exists canonical iso $\text{Mor}(\bigoplus F_i, G) \cong \prod \text{Mor}_{\mathcal{O}_X}(F_i, G)$ natural in F_i, G .

product in \mathcal{O}_X -Mod: $F \otimes_{\mathcal{O}_X} G = \text{sheafify}(U \rightarrow F(U) \otimes_{\mathcal{O}_X(U)} G(U))$

Fact $\exists!$ \mathcal{O}_X -mod structure s.t. $F(U) \otimes_{\mathcal{O}_X(U)} G(U) \rightarrow (F \otimes_{\mathcal{O}_X} G)(U)$ hom of $\mathcal{O}_X(U)$ -mods

Universal property: $\text{Hom}_{\mathcal{O}_X}(F \otimes_{\mathcal{O}_X} G, H) = \text{Bilinear}_{\mathcal{O}_X}(F \times G, H)$

Rmk Stalks are $\text{Hom}_{\mathcal{O}_{X,x}}(F_x, G_x), \bigoplus (F_i)_x, F_x \otimes_{\mathcal{O}_{X,x}} G_x$.

for this require M finitely presented: \exists exact $\bigoplus_{\text{finite}} R \rightarrow \bigoplus_{\text{finite}} R \rightarrow M \rightarrow 0$

Examples on $X = \text{Spec } R: \bigoplus \tilde{M}_i \cong \tilde{\bigoplus M_i}, \widetilde{M \otimes_R N} \cong \tilde{M} \otimes_{\mathcal{O}_X} \tilde{N}, \widetilde{\text{Hom}_R(M, N)} \cong \text{Hom}_{\mathcal{O}_X}(\tilde{M}, \tilde{N})$

Algebra $\text{Hom}_R(M \otimes_R N, P) \cong \text{Hom}_R(M, \text{Hom}_R(N, P))$ canonically, for R -mods M, N, P (so \otimes & Hom are adjoint)

Fact $\text{Hom}_{\mathcal{O}_X}(F \otimes_{\mathcal{O}_X} G, H) \cong \text{Hom}_{\mathcal{O}_X}(F, \text{Hom}_{\mathcal{O}_X}(G, H))$ canonically & functorial in F, G, H .

Cor $F \otimes_{\mathcal{O}_X} \cdot, \text{Hom}_{\mathcal{O}_X}(G, \cdot)$ adjoint, $F \otimes_{\mathcal{O}_X} \cdot$ right exact, $\text{Hom}_{\mathcal{O}_X}(G, \cdot)$ left exact.

Fact $f: X \rightarrow Y \Rightarrow f^{-1}(F \otimes_{\mathcal{O}_Y} G) \cong f^{-1}F \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}G$ canonically (F, G \mathcal{O}_Y -mod)

6.7 Pullback

Rmk $R \rightarrow S$ rings, M R -mod, N S -mod

$\Rightarrow M \otimes_R N$ is $\begin{cases} R\text{-mod since } N \text{ } R\text{-mod via } R \rightarrow S & (r \cdot (m \otimes n) = (rm) \otimes n = m \otimes rn) \\ S\text{-mod by } s \cdot (m \otimes n) = m \otimes sn \end{cases}$

similarly: $X \xrightarrow{f} Y$ $\Rightarrow f^*F = f^{-1}(F) \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{O}_X$ is an $f^{-1}\mathcal{O}_X$ -mod but also an \mathcal{O}_X -mod!

can prove this using universal property, or by hand thinking about \mathcal{O} of presheaves.

Fact $\exists!$ \mathcal{O}_X -mod structure s.t. presheaf tensor product $f^{-1}(F)(U) \otimes_{f^{-1}\mathcal{O}_Y(U)} \mathcal{O}_X(U) \rightarrow f^*F(U)$ is $\mathcal{O}_X(U)$ -mod hom $\mathcal{O}_X(U)$ -mod as by Rmk.

Example $f^*\mathcal{O}_Y = \mathcal{O}_X$ (since $f^{-1}\mathcal{O}_Y \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{O}_X \cong \mathcal{O}_X$ canonically)

Exercise $X \xrightarrow{f} Y \xrightarrow{g} Z \Rightarrow f^* \circ g^* = (g \circ f)^*$ (use last Fact in 6.4, using Sec.1.9)
 $f^*(F \otimes_{\mathcal{O}_Y} G) = f^*F \otimes_{\mathcal{O}_X} f^*G$ canonically & functorial

Upshot $f: X \rightarrow Y$ morph of ringed spaces $\Rightarrow \text{Mod}_{\mathcal{O}_X}(X) \xrightarrow{f^*} \text{Mod}_{\mathcal{O}_Y}(Y)$ and $\leftarrow f^*$

Theorem f^*, f_* are adjoint functors: $\text{Mor}_{\mathcal{O}_X}(f^*F, G) \cong \text{Mor}_{\mathcal{O}_Y}(F, f_*G)$

(exercise) hence f_* left exact, f^* right exact

Hwk 3 f_* commutes with limits \varprojlim for example \prod , f^* commutes with colimits \varinjlim for example \oplus

Example $f^*(\oplus \mathcal{O}_Y) = \oplus f^*\mathcal{O}_Y = \oplus \mathcal{O}_X$.
 (product in category of \mathcal{O}_X -Mods) (coproduct in cat. of \mathcal{O}_X -Mods)

6.8 \tilde{M} on any scheme

M R -mod, $X \xrightarrow{\text{canonical}} \text{Spec } \Gamma(X, \mathcal{O}_X) \xrightarrow{\alpha} \text{Spec } R$ then get $F_M := \alpha^* \tilde{M}$
 (ASSUME given a ring hom $R \rightarrow \Gamma(X)$)

Easier: $(X, \mathcal{O}_X) \xrightarrow{\pi} \text{ringed space (point, } R)$ (on sheaves $\pi_* \mathcal{O}_X = \Gamma(X) \leftarrow R$) (GIVEN)

$F_M := \pi^* M$
 = sheafify $(U \mapsto M \otimes_R \mathcal{O}_X(U))$ (since $\pi^{-1} M \otimes_{\pi^{-1} R} \mathcal{O}_X$ and $(\pi^{-1} R)(U) = R$, $(\pi^{-1} M)(U) = M$)

(get same answer since $X \xrightarrow{\alpha} \text{Spec } R \xrightarrow{\pi_1} (\text{point, } R)$, $\tilde{M} = \pi_1^* M$ by construction, $\pi^* = \alpha^* \pi_1^*$)

Claim $f: Y \rightarrow X$ (morph of ringed spaces) $\Rightarrow f^* F_M = F_N$ where $N = M \otimes_{\Gamma(X)} \Gamma(Y)$ is $\Gamma(Y)$ -module
 M $\Gamma(X)$ -module (case $R \xrightarrow{\text{id}} \Gamma(X)$)

Pf $Y \xrightarrow{f} X$
 $\pi_Y \downarrow \quad \downarrow \pi_X$
 $(\text{point, } \Gamma(Y)) \xrightarrow{\psi} (\text{point, } \Gamma(X))$
 (using $f^\#: \Gamma(X) \rightarrow \Gamma(Y)$)
 $f^* \pi_X^* M = \pi_Y^* \psi^* M$
 $\psi^* M = \psi^{-1} M \otimes_{\psi^{-1} \Gamma(X)} \Gamma(Y) = M \otimes_{\Gamma(X)} \Gamma(Y)$ \square

Cor $\alpha: \text{Spec } S \rightarrow \text{Spec } R$ M R -mod $\Rightarrow \alpha^* \tilde{M} = \widetilde{M \otimes_R S}$
 (S is R -mod via the ring hom $R \rightarrow S$) $\alpha^\#$

Example $D_f = \text{Spec } R_f \hookrightarrow \text{Spec } R \Rightarrow \tilde{M}|_{D_f} = \widetilde{M \otimes_R R_f} = \tilde{M}_f$
 (stronger statement than saying $\tilde{M}(D_f) = M_f$)

6.9 Classification of \mathcal{O}_X -homs $\tilde{M} \rightarrow F$

Lemma $X = \text{Spec } R \Rightarrow \text{Hom}_{\mathcal{O}_X}(\tilde{M}, F) \xrightarrow{\cong} \text{Hom}_R(M, \Gamma(X, F)) \quad \forall \mathcal{O}_X\text{-mod } F$
 (compare Sec.2.3) $\varphi \mapsto \varphi_X$ $\Gamma(X, F) = F(X)$

Pf $\pi: (X, \mathcal{O}_X) \rightarrow (\text{point, } R)$ morph of ringed spaces ($\pi^\#: R \xrightarrow{\text{id}} \pi_* \mathcal{O}_X = \mathcal{O}_X(X) = R$)
 $\tilde{M} = \pi^* M, \Gamma(X, F) = \pi_* F$
 $\Rightarrow \text{Hom}_{\mathcal{O}_X}(\tilde{M}, F) = \text{Hom}_{\mathcal{O}_X}(\pi^* M, F) \cong \text{Hom}_R(M, \pi_* F) = \text{Hom}_R(M, \Gamma(X, F))$. \square
 (π^*, π_* adjoint)

Exercise Using 6.6: $\text{Hom}_{\mathcal{O}_X}(F_M, F) \xrightarrow{\cong} \text{Hom}_R(M, F(X))$ using $R \xrightarrow{\text{given}} \Gamma(X, \mathcal{O}_X)$ to make $F(X)$ an R -mod.

7. (QUASI-)COHERENT SHEAVES

7.1 QCoh(X)

Fact " \Leftarrow " holds also if just assume \mathcal{O}_X is coherent

Recall F coherent $\implies F$ locally finitely presented (Sec. 6.3) and " \Leftarrow " holds if X locally Noetherian scheme. } now weaken this condition by dropping finiteness

Def F quasi-coherent \iff F is locally presented, i.e. $\forall x, \exists$ open $x \in U \subseteq X$
 $\iff \exists \bigoplus_{i \in I} \mathcal{O}_U \rightarrow \bigoplus_{j \in J} \mathcal{O}_U \rightarrow F|_U \rightarrow 0$ exact.
 (any ringed space (X, \mathcal{O}_X)) where the maps are morphs of \mathcal{O}_U -mods where $\mathcal{O}_U = \mathcal{O}_X|_U$

summary: coherent \implies locally finitely presented \implies quasi-coherent (= locally presented)
 vector bundle \implies locally generated by finitely many sections \implies locally generated by sections

Lemma For $X = \text{Spec } R$: $(\exists$ exact sequence of \mathcal{O}_X -mods $\bigoplus_{i \in I} \mathcal{O}_X \rightarrow \bigoplus_{j \in J} \mathcal{O}_X \rightarrow F \rightarrow 0$) \iff ($F \cong \tilde{M}$ some R -module M)

Pf (\implies) Let $M = \bigoplus_{j \in J} R / \text{Im}(\bigoplus_{i \in I} R \rightarrow \bigoplus_{j \in J} R)$ (taking global sections)

by exact functor from 6.4: $\begin{matrix} \bigoplus_{i \in I} \mathcal{O}_X & \longrightarrow & \bigoplus_{j \in J} \mathcal{O}_X & \longrightarrow & F & \longrightarrow & 0 & \text{exact} \\ \parallel & & \parallel & & \parallel & & \parallel & \\ \bigoplus_{i \in I} \tilde{R} & \longrightarrow & \bigoplus_{j \in J} \tilde{R} & \longrightarrow & \tilde{M} & \longrightarrow & 0 & \text{exact} \end{matrix}$ } by uniqueness of cokernels up to iso: $F \cong \tilde{M}$

(\impliedby) $F = \tilde{M}$: pick $J =$ set of generators m_j for R -mod M (e.g. $J = M$)
 pick $I =$ " " " " k_i " " $\text{Ker}(\bigoplus_{j \in J} R \rightarrow M)$
 apply \sim to $\bigoplus_{i \in I} R \rightarrow \bigoplus_{j \in J} R \rightarrow M \rightarrow 0$. send 1 in i -th copy of R to k_i send 1 in j -th copy of R to m_j

Cor For any scheme X ,

$F \in \text{QCoh}(X) \iff \forall x \in X \exists$ affine open $x \in U \cong \text{Spec } R, F|_U \cong \tilde{M}$ some R -mod
 $F \in \text{Coh}(X) \iff$ in addition require M is coherent R -mod

- $\cdot M$ finitely generated
- $\cdot \text{Ker}(R^n \xrightarrow{\varphi} M)$ is f.g., any $n \in \mathbb{N}$ any hom of R -mods

Idea: want \forall f.g. submod of M to have finite presentation, indeed get exact sequence $R^m \rightarrow R^n \xrightarrow{\varphi} \text{Im } \varphi \rightarrow 0$ map to gens. of $\text{Ker } \varphi$

(Pf $\forall x$ pick U so that Lemma applies.)

Rmk If R Noeth., coherent = f.g. (since R^n f.g., so its submods are f.g. as R Noeth.)

Example X loc. Noeth. scheme $\implies \mathcal{O}_X$ is coherent \implies ideal sheaf of any closed subsch. is coherent.

Rmk For any scheme X ,

$F \in \text{QCoh}(X) \iff \exists$ affine open cover $X = \cup U_i$ s.t. $F|_{U_i} \cong \tilde{M}_i$ for R_i -mods M_i
 $F \in \text{Coh}(X) \iff$ " and M_i coherent. (WLOG: $R_i = \mathcal{O}_X(U_i), M_i = F(U_i)$)

Rmk restriction to open $V \subseteq X$: $\text{QCoh}(X) \rightarrow \text{QCoh}(V), \text{Coh}(X) \rightarrow \text{Coh}(V)$

Pf $x \in V \cap U = \cup D_{f_i}$ for $f_i \in R$ then $F|_U|_{D_{f_i}} \cong \tilde{M}|_{D_{f_i}} \cong \tilde{M}_{f_i}$ (and use fact that localization preserves "coherent" property) Example in 6.8
 so again locally module. \square

Why is quasi-coherence a good notion?

Rings^{op} → Aff, $R \mapsto (\text{Spec}(R), \mathcal{O}_{\text{Spec} R})$ equivalence of cats

$R\text{-Mods} \rightarrow \mathcal{O}_{\text{Spec}(R)}\text{-Mods}$, $M \mapsto \tilde{M}$ not equivalence of cats

notice $F \in \mathcal{O}_X\text{-Mods}$
if $o \in U$
else

Example $X = \text{Spec } k[x] = \mathbb{A}_k^1$, skyscraper sheaf at 0: $F(U) = \begin{cases} k[x] & \text{if } 0 \in U \\ 0 & \text{else} \end{cases}$
 \Rightarrow if the above were an equivalence of cats, then $F \cong \tilde{M}$ some $k[x]\text{-mod } M$
 so $k[x] = F(X) \cong \tilde{M}(X) = M$. But $k[x] = \mathcal{O}_X$ is not isomorphic to F !

Solution restrict which \mathcal{O}_X -mods you allow: want them locally to look like \tilde{M} , just like when we studied sheaves of ideals that locally look like \tilde{I}

Will show later: For $X = \text{Spec } R: R\text{-Mods} \rightarrow \text{QCoh}(X)$ equivalence of categories $M \mapsto \tilde{M}$
 $F(X) \leftarrow F$

7.2 Overview of general properties of $\text{QCoh}(X)$ and $\text{Coh}(X)$ for X scheme

1) $\text{Coh}(X)$ abelian category, and $\text{QCoh}(X)$ " " " "
 $\text{Coh}(X) \xrightarrow{\text{incl}} \mathcal{O}_X\text{-Mod}$
 $\text{QCoh}(X) \xrightarrow{\text{incl}} \mathcal{O}_X\text{-Mod}$ are exact functors (for $\text{Coh } X$ properties enough if X ringed)

In particular can take Ker, Coker, Image in both (not in $\text{Vect}(X)$)
 2) $0 \rightarrow F_1 \rightarrow F_2 \rightarrow F_3 \rightarrow 0$ exact in $\mathcal{O}_X\text{-Mods}$.
 Two of the $F_i \in \text{QCoh}(X) \Rightarrow$ all three are. Same holds for $\text{Coh}(X)$ (not for $\text{Vect}(X)$)
 Trick $0 \rightarrow F_1 \rightarrow F_2 \rightarrow F_3$ exact, and F_2, F_3 are, then F_1 is. (Pf. $F_1 \cong \text{Ker}(F_2 \rightarrow F_3)$, use (1).□)
 Easy for QCoh since locally hom of mods $M_1 \rightarrow M_2$ so take \cap of Ker, Coker, Im

3) Can take finite $\oplus, \cdot \otimes_{\mathcal{O}_X}, \text{Hom}_{\mathcal{O}_X}(\cdot, \cdot)$ in $\text{QCoh}(X), \text{Coh}(X)$ and $\text{Vect}(X)$

4) Gabriel-Rosenberg thm
 X quasi-compact & separated (e.g. variety) $\Rightarrow X$ is determined up to iso by $\text{QCoh } X$!
 for $\text{QCoh}, \text{Hom}_{\mathcal{O}_X}(F, G)$ need assume F loc. finitely presented

5) X loc. Noeth. scheme, $Z \xrightarrow{i} X$ closed subsc. $\Rightarrow 0 \rightarrow \mathcal{I}_{Z/X} \rightarrow \mathcal{O}_X \rightarrow i_* \mathcal{O}_Z \rightarrow 0$ exact in $\text{Coh } X$
 finite type subsheaf $F \subseteq G, G \in \text{Coh}(X) \Rightarrow F \in \text{Coh}(X)$
 $\varphi: F \rightarrow G, G \in \text{Coh } X, F$ finite type $\Rightarrow \text{Ker } \varphi$ finite type
 $\varphi: F \rightarrow G, G \in \text{Coh } X, \varphi_x: F_x \rightarrow G_x$ injective $\Rightarrow \varphi|_U: F|_U \rightarrow G|_U$ inj. some open $x \in U$
 combine to prove kernels exist in $\text{Coh } X$

Hwk 4: Picard group $\text{Pic}(X) = \{\text{isomorphism classes of invertible sheaves}\}$
 group operation is $\cdot \otimes_{\mathcal{O}_X}$ (abelian group as $F \otimes_{\mathcal{O}_X} G \cong G \otimes_{\mathcal{O}_X} F$)
 we proved it in case $F=0$ in Pf. claim in Sec. 6.2.

7.3 Pullback preserves quasi-coherence

$f: X \rightarrow Y$ morph ringed spaces
 without this can fail e.g. $f^* \mathcal{O}_Y = \mathcal{O}_X$ so if \mathcal{O}_Y coh, \mathcal{O}_X not coh, then fails

Claim $f^*: \text{QCoh}(Y) \rightarrow \text{QCoh}(X)$. If X loc. Noeth. scheme $\Rightarrow f^*: \text{Coh } Y \rightarrow \text{Coh } X$.

Pf if $\bigoplus_I \mathcal{O}_Y|_U \rightarrow \bigoplus_J \mathcal{O}_Y|_U \rightarrow G|_U \rightarrow 0$ exact ($f^{-1}U \subseteq Y$ open)
 $\text{Vect } Y \xrightarrow{f^*} \text{Vect } X$
 apply g^* where $g = f|_{f^{-1}U}: f^{-1}U \rightarrow U$, using g^* right exact & commutes with \oplus :
 $\bigoplus_I \mathcal{O}_X|_{f^{-1}U} \rightarrow \bigoplus_J \mathcal{O}_X|_{f^{-1}U} \rightarrow f^* G|_{f^{-1}U} \rightarrow 0$ exact, and $x \in f^{-1}U$ open. using X loc. Noeth.
 $F \in \text{Coh}(Y) \Rightarrow F$ locally finitely presented $\Rightarrow f^* F$ loc. finitely presented $\Rightarrow f^* F \in \text{Coh}(X)$ □
 (above proof for I, J finite)

7.4 Push-forwards for X Noetherian

Claim $f: X \rightarrow Y$ morph of schemes, X Noetherian $\Rightarrow f_*: \text{QCoh } X \rightarrow \text{QCoh } Y$
 issue is f^{-1} (affine) need not be affine. For affine morphs you get result by Sec. 6.5

Pf $0 \rightarrow F \rightarrow \prod F|_{U_i} \rightarrow \prod F|_{U_i \cap U_j} \rightarrow \dots$ exact by sheaf property, where $X = \cup U_i$ affine open cover
 Sec. 6.7 restr. take differences of sections on overlaps (Sec. 1.4) $U_i \cap U_j = \cup U_{ijk}$ " " "
 Recall f_* left-exact & commutes with limits e.g. with $\prod \Rightarrow 0 \rightarrow f_* F \rightarrow \prod f_*(F|_{U_i}) \rightarrow \prod f_*(F|_{U_i \cap U_j})$ exact

WLOG Y open affine = $\text{Spec } R$ (replace X by $f^{-1}(\text{Spec } R)$), WLOG $F|_{U_i} = F(U_i)$, so $f_*(F|_{U_i}) = F(U_i)$ similarly for U_{ijk} . If show $\prod f_*(F|_{U_i}), \prod f_*(F|_{U_{ijk}}) \in \text{QCoh}(Y)$ then $f_*F \in \text{QCoh}(Y)$ ← Trick (2) in 7.2 Sec. 6.5

X Noeth \Rightarrow quasi-compact \Rightarrow finite covers $\Rightarrow \prod$ is \oplus , but \sim commutes with \oplus so finally done! \square

Rmk X quasi-compact, separated $\Rightarrow f_*: \text{QCoh } X \rightarrow \text{QCoh } Y$ ← proof above but easier $U_{ijk} = U_i \cup U_j$ affine!

Non-examinable fact f proper, X, Y loc. Noeth. $\Rightarrow f_*: \text{Coh } X \rightarrow \text{Coh } Y$ ← e.g. $A_k^1 \xrightarrow{f} \text{Spec } k$ $f_* \mathcal{O}_X = k[x]$ not finite k -mod

Otherwise in general f_* can ruin (quasi)-coherence ← e.g. $X = A_k^2 \setminus 0 \xrightarrow{f} A_k^2 = Y$ if $f_* \mathcal{O}_X \in \text{QCoh } Y$, then $f_* \mathcal{O}_X = \mathcal{O}_Y$. Let $Z = \text{Spec } k \rightarrow \mathcal{O}_Y \rightarrow \mathcal{O}_Z$ $\Rightarrow \Gamma(Z, f_* \mathcal{O}_X) = 0$ contradiction

7.5 Gluing modules

Similar to Sec. 4.1: R ring $\ni f_1, \dots, f_n$ s.t. $1 \in \langle \text{all } f_i \rangle$ \circledast

data: $M_i: R_{f_i}$ -mod ← (so have \tilde{M}_i on $D_{f_i} \subseteq \text{Spec } R$)

- $\psi_{ij}: (M_i)_{f_j} \rightarrow (M_j)_{f_i}$ iso of $R_{f_i f_j}$ -mods
- $\psi_{ii} = \text{id}$

cocycle condition $(M_i)_{f_j f_k} \xrightarrow{\psi_{ik}} (M_k)_{f_j f_i} \xrightarrow{\psi_{ji}} (M_j)_{f_i f_k} \xrightarrow{\psi_{ij}} (M_i)_{f_j f_k}$

← case $k=i$ get $\psi_{ji} = \psi_{ij}^{-1}$. Take \sim get condns of Sec. 4.1

← (so $\tilde{M}_i \cong \tilde{M}_j$ on $D_{f_i f_j} \subseteq \text{Spec } R$)

Define $M := \text{Ker} \left(\begin{array}{c} \bigoplus_i M_i \xrightarrow{\varphi} \bigoplus_{i,j} (M_i)_{f_j} \\ (m_i) \longmapsto \left(\frac{m_i}{1} - \psi_{ji} \left(\frac{m_j}{1} \right) \right) \end{array} \right)$ ← Idea: local data which agrees on overlaps

Call $\pi_i: M \rightarrow M_i$ the projections.

Gluing Lemma π_i induces isos $M_{f_i} \rightarrow M_i$ and $\psi_{ij} \circ \frac{\pi_i(m)}{1} = \frac{\pi_j(m)}{1} \forall m \in M$

Pf Enough to show π_ℓ iso after localising at every prime $q \in \text{Spec } R_{f_\ell}$

$\Rightarrow q = p R_{f_\ell}$ with $f_\ell \notin p \in \text{Spec } R$. By exactness of localisation $(M_{f_\ell})_q = M_p = \text{Ker} \left(\bigoplus (M_i)_p \xrightarrow{\varphi_p} \bigoplus ((M_i)_p)_{f_j} \right)$

$f_\ell \in R_p$ is unit so WLOG replace: $R \rightsquigarrow R_p, M \rightsquigarrow M_p, M_i \rightsquigarrow (M_i)_p, f_\ell \rightsquigarrow 1$. ← R_p -mods

Abbreviate $N = M_p$ so: $\pi_\ell: M = \text{Ker } \varphi_p \cap (N \oplus \bigoplus_{i \neq \ell} M_i) \rightarrow N$

$\psi_{\ell i}: N_{f_i} \cong (M_i)_1 = M_i$ ← "WLOG" in sense that localising at f_ℓ is like localising at 1 since f_ℓ is a unit in R_p

WLOG $M_i = N_{f_i}$ (identify via $\psi_{\ell i}$), so cocycle cond. becomes: $N_{f_j f_k} \xrightarrow{\psi_{jk}} (M_k)_{f_j} \xrightarrow{\psi_{jk}} (M_j)_{f_k}$

$\Rightarrow \psi_{jk}$ is now id

$\Rightarrow \psi_{jk} = \text{id}$ hence id

$\Rightarrow 0 \rightarrow N \xrightarrow{\text{natural}} \bigoplus_i N_{f_i} \xrightarrow{\varphi_p} \bigoplus_{i,j} N_{f_i f_j}$

$(N \rightarrow N \oplus \bigoplus_{i \neq \ell} N_{f_i}, n \mapsto n \oplus \bigoplus_{i \neq \ell} \frac{n}{f_i}) \quad (x_i) \mapsto \left(\frac{x_i}{1} - \frac{x_j}{f_j} \right)$

Sub-claim This is exact ($\Rightarrow N = \text{Ker } \varphi_p = M, \pi_\ell$ iso, $\psi_{jk} = \text{id}$ under identifications via π_i) \square

Pf Enough to prove after localising at each max ideal \mathfrak{m} ← See 3.0

By \circledast not all $f_i \in \mathfrak{m}$ otherwise $1 \in \langle \text{all } f_i \rangle \subseteq \mathfrak{m} \nabla$

Say $f_k \notin \mathfrak{m}$, so WLOG replace $N \rightsquigarrow N_{f_k}, R \rightsquigarrow R_{f_k}, f_k \rightsquigarrow 1$:

$\Rightarrow 0 \rightarrow N \rightarrow \underbrace{N \oplus \bigoplus_{i \neq k} N_{f_i}}_{= N_{f_k}} \rightarrow \bigoplus_{i,j} N_{f_i f_j}$

clearly injective

$n \oplus \bigoplus_{i \neq k} n_i \in \text{Ker}$ then $\frac{n}{1} = \frac{n_i}{f_i} \in N_{f_i f_k} = N_{f_i} \forall i \square$

hence $= n \oplus \bigoplus_{i \neq k} \frac{n}{f_i}$ so image of n via previous map

7.6 $QCoh(X)$, $Coh(X)$, $Vect(X)$ for $X = Spec R$

Theorem

$$\begin{array}{ccc} R\text{-Mods} & \xrightarrow{\quad} & QCoh(X) \\ M & \xrightarrow{\quad} & \tilde{M} \\ F(X) = \Gamma(X, F) & \xleftarrow{\quad} & F \end{array}$$

← means: the two given functors compose to functors which are naturally iso to identity functors

Pf. Easy direction: $M \mapsto F = \tilde{M} \mapsto F(X) = \tilde{M}(X) = M$. Converse: given F want $F \cong \tilde{F}(X)$.

\Rightarrow locally $\forall p \in X, \exists p \in D_f$ s.t. $F|_{D_f} \xrightarrow{\varphi_f} \tilde{N}$ some R_f -mod N

By Cor in 7.1 using that D_f are basis of topology and $Spec R$ quasi-compact

cover X by finitely many such, say N_i on $D_{f_i}, i=1, \dots, n$, so $1 \in \langle \text{all } f_i \rangle$

\Rightarrow On overlaps: $\psi_{ij} : (\tilde{N}_i)_{f_j} \xrightarrow{\varphi_{f_i}^{-1}} F|_{D_{f_i f_j}} \xrightarrow{\varphi_{f_j}} (\tilde{N}_j)_{f_i}$ satisfy cocycle condition

← since $(N_i)_{f_j}$ and other two are identified with $F|_{D_{f_i f_j}}$

\Rightarrow by gluing them $\exists M$ with $M_{f_i} = N_i$ compatibly with the ψ_{ij}

But then \tilde{M}, F have isomorphic local gluing data for cover $X = D_{f_1} \cup \dots \cup D_{f_n}$ so $\tilde{M} \cong F$.

(Explicitly: $m \in M \mapsto m_i = \frac{m}{1} \in M_{f_i} = N_i \xrightarrow{\varphi_{f_i}^{-1}} s_i \in F(D_{f_i})$ and $s_i|_{D_{f_i f_j}} = s_j|_{D_{f_i f_j}}$ so globalises to unique $s \in F(X)$. Recall $M \rightarrow F(X)$ determines $\tilde{M} \rightarrow F$ by Sec. 6.9)

Cor $X = Spec R$: $F \in Coh X \iff F = \tilde{M}$ for coherent module $M \cong F(X)$ and if R Noeth. get: $\iff F(X)$ f.g. R -mod

Pf $F = \tilde{F}(X)$ by Theorem. In definition of coherent take global sections $\Rightarrow F(X)$ coherent R -mod, and conversely if M coherent get \tilde{M} coherent since \sim is exact & fully faithful. \square

Fact $X = Spec R$: $F \in Vect X \iff F = \tilde{M}$ for f.g. flat R -mod (\iff f.g. projective R -mod)

7.7 Flatness

Def F is flat \mathcal{O}_X -mod if $F \otimes_{\mathcal{O}_X} \cdot$ is exact

so $\iff F_x$ flat $\mathcal{O}_{X,x}$ -mod $\forall x$.

means in R -mods $Hom(M, \cdot)$ exact. ($\iff M$ is a direct summand of some free R -mod)

Example $U \xrightarrow{i} X$ open subsch. $\Rightarrow i_* \mathcal{O}_U$ is flat \mathcal{O}_X -mod

← since exactness can be checked on stalks
← stalk is either 0 or $\mathcal{O}_{X,x}$ and $\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{X,x}} \cdot = id$

Rmk Morph of schemes $f: X \rightarrow Y$ is flat $\iff \mathcal{O}_X$ flat $f^{-1} \mathcal{O}_Y$ -module (see \oplus in Sec. 3.6)

Claim $f: X \rightarrow Y$ flat $\Rightarrow f^*: \mathcal{O}_Y\text{-Mod} \rightarrow \mathcal{O}_X\text{-Mod}$ is exact (not just right exact)

Pf f^{-1} is exact $\Rightarrow \mathcal{O}_Y\text{-Mod} \xrightarrow{f^{-1}} f^{-1} \mathcal{O}_Y\text{-Mod}$ exact, $F \mapsto f^{-1} F$

$\otimes_{f^{-1} \mathcal{O}_Y} \mathcal{O}_X$ exact by Rmk $\Rightarrow f^* F = f^{-1} F \otimes_{f^{-1} \mathcal{O}_Y} \mathcal{O}_X$ is composite of two exact functors \square

Facts (X, \mathcal{O}_X) ringed space

- free \Rightarrow flat
- Can take \oplus of flat mods

so kernels are flat

← Taking stalks, all follow from analogous statements for R -mods

Combine (break into SES's show images $(F_n \rightarrow F_{n-1})$ flat) $\left\{ \begin{array}{l} \cdot \mathcal{O} \rightarrow F_1 \rightarrow F_2 \rightarrow F_3 \rightarrow \mathcal{O} \text{ exact : outer two or last two flat } \Rightarrow \text{ all flat} \\ \cdot \dots \rightarrow F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow F \rightarrow \mathcal{O} \text{ exact, all flat } \Rightarrow \text{ " } \\ \cdot \text{ " , } F_3 \text{ flat } \Rightarrow \text{ sequence } \otimes_{\mathcal{O}_X} \text{ any } \mathcal{O}_X\text{-mod } G \text{ is exact} \end{array} \right.$

(so "flat resolution of flat \mathcal{O}_X -mod F ")

8. Čech Cohomology

8.1 Čech complex

X top. space, $X = \cup U_i$ open cover

$$\begin{cases} U_{ij} = U_i \cap U_j \\ U_{ijk} = U_i \cap U_j \cap U_k \\ \dots \end{cases}$$

$U_I = U_{i_0} \cap \dots \cap U_{i_n}$ for $I = (i_0, \dots, i_n)$ multi-index, abbreviate $|I| = n$

$F \in \text{Ab}(X)$

$$C^n = \check{C}_{\{U_i\}}^n = \prod_{|I|=n} \Gamma(U_I, F)$$

← so $s \in C^n$ is a collection $s_I \in F(U_I)$

ordered, allow repetitions

size is actually $n+1$

$$d = d^n : C^n \rightarrow C^{n+1}$$

$$(ds)_I = \sum_{j=0}^{n+1} (-1)^j s_{I_j} |_{U_I}$$

← where $I_j = (i_0, \dots, \hat{i}_j, \dots, i_{n+1})$

omit

later also use notation $I_{jk\dots}$ if omit i_j, i_k, \dots

$\in F(U_I)$ so sum makes sense.

Example

$$C^0 = \prod_i \Gamma(U_i) \xrightarrow{d} \prod_{i,j} \Gamma(U_{ij}) = C^1$$

$$(s_i) \longmapsto (s_j |_{U_{ij}} - s_i |_{U_{ij}})$$

$$\begin{cases} i_0 = i, i_1 = j \\ I = (i_0, i_1) \\ I_0 = (i_1) = j \end{cases}$$

$$C^1 = \prod_{i,j} \Gamma(U_{ij}) \xrightarrow{d} \prod_{i,j,k} \Gamma(U_{ijk}) = C^2$$

$$(s_{ij}) \longmapsto (s_{jk} |_{U_{ijk}} - s_{ik} |_{U_{ijk}} + s_{ij} |_{U_{ijk}})$$

← if you took C3.1 Algebraic Top. notice similar to simplicial differential

Claim $d^2 = 0$, so (C^*, d) is a complex

Pf

$$(dds)_J = \sum_{k=0}^{n+2} (-1)^k (ds)_{J_k} |_{U_J} = \sum_{k=0}^{n+2} \left(\sum_{j < k} (-1)^{k+j} s_{J_{kj}} |_{U_J} + \sum_{j > k} (-1)^{k+j-1} s_{J_{kj}} |_{U_J} \right)$$

$$= 0. \quad \square$$

← anti-symmetry if swap j, k (notice full sum is over all $j \neq k$)

Def

$$H^n(X, F) = \check{H}_{\{U_i\}}^n(X, F) = \text{Ker } d^n / \text{Im } d^{n-1}$$

← (can depend on choice of U_i)

Lemma $H^0(X, F) = \Gamma(X, F)$

Pf $s_j |_{U_{ij}} = s_i |_{U_{ij}}$ says s glues to global section. \square

Terminology 1) hom of complexes $f : C^n \rightarrow C^n$ is chain map if $f \circ d = d \circ f$

2) $h : C^n \rightarrow C^{n-1}$ is chain homotopy between chain maps f, g if $f - g = d \circ h + h \circ d$

Consequences: 1) $f : H^n \rightarrow H^n$ via $f[c] = [fc]$ well-defined

$$\begin{cases} [c] = [c + db] \\ \text{but} \\ [fcb] = [dfb] = 0 \end{cases}$$

2) $f = g : H^n \rightarrow H^n$ ← ($dc = 0 \Rightarrow [fc - gc] = [dhc] = 0$)

Key trick To show $H^k = 0$ can find chain homotopy between $\text{id}, 0$.

← i.e. C^* is exact, also called acyclic

8.2 Čech complex with ordering

e.g. if X quasi-compact

Repetitions of indices are annoying since $C^n \neq 0$ all $n \geq 0$ even if finite # U_i

Trick pick total ordering on indices

C_+^n : as C^n but only allow $I = (i_0, \dots, i_n)$ if $i_0 < i_1 < \dots < i_n$, d as before

$\Rightarrow C_+^n \subseteq C^n$ subcomplex

Claim $H_+^n \cong H^n$

so if finite cover with N sets,
 $C_+^n = 0$ for $n \geq N$
 $H_+^n = 0$ "

I'm doing a hands-on proof based on
 Serre "FAC" 1955 sec. 20, p. 214
 Godement "Théorie des faisceaux" 1958 p. 60
 Eilenberg & Steenrod "Foundations of Alg. Top." 1952, VI. 6

Non-examinable Proof ("Serre's Trick")

Let S_* = free abelian group generated by all index sets I , so $S_n = \langle I : |I| = n \rangle$

Differential: $\partial I = \sum (-1)^j I_j$ so $\partial: S_n \rightarrow S_{n-1}$.

(I is really a function $\{0, 1, \dots, n\} \rightarrow \{\text{indices}\}$)

S_+^* = subgroup generated by strictly ordered index sets I

(so strictly increasing function for chosen total order on set)

Step 1 S_*, S_+^* are acyclic

$l := \text{minimal index}$

Pf $h: S_+^* \rightarrow S_*$, $h(I) = \begin{cases} (l, I) & \text{if } l \neq i_0 \\ 0 & \text{if } l = i_0 \end{cases} \Rightarrow \text{if } l \neq i_0: \partial h I = \partial(l, I) = I + \sum (-1)^{j+1} (l, I_j)$
 $h \partial I = h \sum (-1)^j I_j = \sum (-1)^j (l, I_j)$

$\Rightarrow I = (\partial h + h \partial) I$. Exercise: check same holds if $l = i_0$.

$\Rightarrow \text{id} - 0 = \partial h + h \partial$ ✓ For S_* it is even easier: $h(I) = (l, I)$ works. \square

Step 2 $f(I) := \begin{cases} 0 & \text{if } \exists \text{ repeated indices in } I \\ \text{sign}(\sigma) \cdot \sigma(I) & \text{otherwise, where } \sigma \text{ unique permutation s.t. } \sigma I \text{ ordered} \end{cases}$

$\sigma_{j_0} < \sigma_{j_1} < \dots$

$\Rightarrow f$ chain map, $f = \text{id}$ on S_0 , $f(S_*) \subseteq S_+^*$, $f \circ f = f$ (i.e. f is id on S_+^* , f is a projection to S_+^*)

Pf $\sigma(I) \in S_+^*$ and if I is ordered then $\sigma = \text{id}$. On S_0 : $f((i_0)) = (i_0)$.

$\partial f I = \sum (-1)^j \text{sign}(\sigma) \sigma(I)_j \iff \text{for } k = \sigma^{-1}(j)$ get same set, $\text{sign}(\sigma) = \text{sign}(\tau) \cdot (-1)^{k-j}$ since $f \partial I = \sum (-1)^k \text{sign}(\tau) \tau(I_k)$ τ does an extra $k-j$ transpositions to move i_j to position k

Step 3 General trick: C_* free acyclic complex, a chain map $f: C_* \rightarrow C_*$ is $\text{id}: C_0 \rightarrow C_0$

then f, id are chain homotopic: $\exists k: C_* \rightarrow C_{*+1}$ with $f - \text{id} = \partial k + k \partial$

Pf Build k inductively by equation $\partial_{n+1} \circ k_n = f_n - \text{id} - k_{n-1} \circ \partial_n$

Trick pick basis for C_0 , pick such c_i for each basis element c_0 , define $k_0 c_0 = c_1$

$C_0 \xleftarrow{\partial_1} C_1$ want $\partial_1 k_0 c_0 = 0$ but: $C_0 \xleftarrow{\partial_1} C_1$
 $f_0 = \text{id} \downarrow \downarrow f_1$
 $C_0 \xleftarrow{\partial_1} C_1$ ($f_0 - \text{id} = 0$)
 $0 = C_{-1} \rightarrow 0 \leftarrow C_0 \leftarrow \exists c_1$ since C_* exact

choices!

$C_{n-2} \xleftarrow{\partial_{n-1}} C_{n-1} \xleftarrow{\partial_n} C_n$ assume by induction: $\partial_n k_{n-1} = f_{n-1} - \text{id} - k_{n-2} \partial_{n-1}$ *

$f_{n-2} \downarrow \downarrow f_{n-1} \downarrow \downarrow f_n$
 $C_{n-2} \xleftarrow{\partial_{n-1}} C_{n-1} \xleftarrow{\partial_n} C_n$
 $\partial_n (f_n - \text{id} - k_{n-1} \circ \partial_n) = f_{n-1} \partial_n - \partial_n - (\partial_n \circ k_{n-1}) \partial_n$
 $\circledast \rightarrow = f_{n-1} \partial_n - \partial_n - (f_{n-1} - \text{id} - k_{n-2} \partial_{n-1}) \partial_n$
 $= 0$ since $\partial \circ \partial = 0$

get equation \circledast for $n+1$.

$\Rightarrow \exists c_{n+1}$ with $(f_n - \text{id} - k_{n-1} \partial_n) C_n = \partial_{n+1} c_{n+1}$. Repeat trick: $k_n(C_n) := c_{n+1}$ for basis elts c_n of C_n

Step 4 chain maps/homotopies on S_*, S_+^* induce corresponding chain maps/homopies on C^*, C_+^*

Pf If $\varphi(I) = \sum n_{II'} \cdot I'$, $n_{II'} \in \mathbb{Z}$ then define $(\check{\varphi}(s))_I = \sum n_{II'} \cdot s_{I'} |_{U_I}$
 (φ hom on S_* or S_+^*) ($\check{\varphi}$ hom on C^* or C_+^* respectively)

Example $d = \check{\varphi}$, and for f of Step 2: $(\check{f}(s))_I = \begin{cases} 0 & \text{if } \exists \text{ repeated indices in } I \\ \text{sign}(\sigma) \cdot s_{\sigma(I)} |_{U_I} & \text{else} \end{cases}$

Conclusion: $\check{f}: C^* \rightarrow C^*$ chain hpic to id and surjects onto C_+^* $\Rightarrow [\check{f}] = \text{id}: H^* \rightarrow H^*$ hence equal. \square

Cor H_+^* is independent of choice of total ordering on set of indices (since $H_+^* \cong H^*$)

$\check{H}_{\{U_i\}}^m(X, F) = 0$ for $m \geq N$ if $X = \cup U_i$ if finite cover with N sets (since $U_i = \emptyset$ in C_+^* if $|I| \geq N$)

Example $X = \mathbb{P}_k^n$ with cover by $N = n+1$ affine sets $U_i \cong \mathbb{A}_k^n$ (HWK 2)

8.3 Affines have no cohomology except H^0

\leftarrow (compare $H^*(\mathbb{C}^n) = 0$ for $* \geq 1$)
in algebraic topology

Theorem $X = \text{Spec } R$

$F \in \text{QCoh}(X)$

$X = \cup U_i$: finite affine open cover

$$\Rightarrow \check{H}^n(X, F) = 0 \text{ for } n \geq 1$$

Pf X separated $\Rightarrow U_I$ all affine (Sec. 5.3, ⑧)

Easy case: minimal index l satisfies $U_l = X$

use ordered Čech cohomology.
 $S \in \mathbb{C}^n, h_s \in \mathbb{C}^{n-1}$
 $I = (i_0, \dots, i_{n-1})$
 $i_0 < i_1 < \dots < i_{n-1}$

$$U_{l, I} = U_l \cap U_I = X \cap U_I = U_I$$

\leftarrow Exercise check case $I = (l, i_1, \dots)$ also works.

chain homotopy: $(hs)_I = \begin{cases} 0 & \text{if } i_0 = l \\ s_{l, I} & \text{if } i_0 \neq l \text{ (so } l < i_0) \end{cases}$

for I with $i_0 \neq l$:

$$\left. \begin{aligned} (d(hs))_I &= \sum (-1)^j (hs)_{I_j} = \sum (-1)^j s_{l, I_j} \\ (h(ds))_I &= (ds)_{l, I} = s_I + \sum (-1)^{j+1} s_{l, I_j} \end{aligned} \right\} \Rightarrow \text{id} = dh + hd$$

\Rightarrow Key Trick \checkmark (sec. 8.1)

General case

$$X = \text{Spec } R = \cup U_i, U_i = \text{Spec } R_i$$

By easy case, know result for space U_l with covering $U(U_l \cap U_i)$, for minimal l .

Ordering of indices does not affect H^* , so know result for \exists any l by Cor of 8.2

\Rightarrow **Reduce to claim**: if C^* exact when restrict to $U_i \forall i$, then C^* exact

$$F \in \text{QCoh}(X), U_I \text{ affine say } \text{Spec } R_I \xrightarrow{7.6} F|_{U_I} \cong \widetilde{M}_I \text{ some } R_I\text{-module } M_I$$

$$C^n = \prod_{|I|=n} F(U_I, F) = \prod_{|I|=n} M_I \text{ finite product so } = \bigoplus \text{ (in particular, an } R\text{-mod) (since } R \rightarrow R_I \text{ from } U_I \rightarrow X)$$

$\Rightarrow C^0 \xrightarrow{d} C^1 \xrightarrow{d} C^2 \rightarrow \dots$ is a complex of R -mods

and by assumption of exactness on U_i have:

$$C^0 \otimes_R R_i \rightarrow C^1 \otimes_R R_i \rightarrow \dots \text{ exact } \forall i$$

\Rightarrow localising further by $\cdot \otimes_{R_i} (R_i)_p$ get exactness of localisation of C^* at each $p \in \text{Spec } R$.

\Rightarrow by Sec. 3.0 deduce exactness of C^* . \square

\leftarrow using $F_I|_{U_i} = \widetilde{M}_I|_{U_i} \cong \widetilde{M}_I \otimes R_i$ by 6.8
and $\bigoplus \widetilde{N}_i = \widetilde{\bigoplus N_i}$
 U_i cover X so $p \in U_i$ some i

8.4 Independence of cover

Theorem X separated, quasi-compact $\Rightarrow \check{H}^*(X, F)$ independent of choice of finite affine open cover

Pf Will use ordered Čech cohomology.

X separated $\Rightarrow \bigcap_{\text{finite}} \text{affines}$ is affine (Sec. 5.3, ⑧)

$$X = \cup U_i, X = \cup V_j \text{ take mixed intersections: } C^{n,m} = \prod_{\substack{|I|=n \\ |J|=m}} \Gamma(U_I \cap V_J, F)$$

$$C^{n,0} \cong \prod_{|I|=n} \check{C}^{\check{}}_{\{V_j \cap U_I\}}(F|_{U_I})$$

$$C^{0,m} \cong \prod_{|J|=m} \check{C}^{\check{}}_{\{U_i \cap V_J\}}(F|_{V_J})$$

finite affine cover of the affine U_I so by 8.3 $H^* = 0$

similar

"bi-complex"

$$\begin{array}{ccccc} \dots & \dots & \dots & & \\ \uparrow & \uparrow & \uparrow & & \\ C^{0,2} & \rightarrow & C^{1,2} & \rightarrow & C^{2,2} \rightarrow \dots \\ \uparrow & & \uparrow & & \uparrow \\ C^{0,1} & \rightarrow & C^{1,1} & \rightarrow & C^{2,1} \rightarrow \dots \\ \uparrow & & \uparrow & & \uparrow \\ C^{0,0} & \rightarrow & C^{1,0} & \rightarrow & C^{2,0} \rightarrow \dots \end{array}$$

\Rightarrow rows & columns are exact except for degree 0:

$$H^0(C^{n,0}) = \prod_{|I|=n} \Gamma(U_I, F) = \check{C}^{\check{}}_{\{U_i\}}(F)$$

$$H^0(C^{0,m}) = \prod_{|J|=m} \Gamma(V_J, F) = \check{C}^{\check{}}_{\{V_j\}}(F)$$

General fact from homological algebra

$C^{i,j}$ bi-complex, $H^i(C^{\bullet, \bullet}) = 0 \forall i > 0, \forall n$
 $H^i(C^{\bullet, m}) = 0 \forall i > 0, \forall m \Rightarrow H^0(C^{\bullet, \bullet})$ complex in n } with iso cohomology $H^*(A^0) \cong H^*(B^0)$

Sketch Pf

Now rows & cols are exact, so can diagram chase, and get a "zig-zag":

$$\begin{array}{ccccccc}
 & & \exists c_3 & \rightarrow & c_2 & \rightarrow & 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 H^1(B^0) & & \exists c_1 & \rightarrow & c & \rightarrow & 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & \hookrightarrow & & \hookrightarrow & & \hookrightarrow \\
 & & H^1(A^0) & & 0 & &
 \end{array}$$

so $H^1(A^0) \rightarrow H^1(B^0)$
 $c \mapsto c_3$
 via the iso \square

8.5 Induced LES on H^*

Recall $\Gamma(X, \cdot): Ab(X) \rightarrow Ab$ is always left exact (Sec. 1.9)

Lemma U open affine \subseteq scheme $X \Rightarrow \Gamma(U, \cdot): Qcoh X \rightarrow Ab$ is exact

Pf Given $F_1 \rightarrow F_2 \rightarrow F_3$ exact. Exactness is local condition (indeed stalks)
 \Rightarrow WLOG $F_i|_U = \tilde{M}_i$. $\tilde{M}_1 \rightarrow \tilde{M}_2 \rightarrow \tilde{M}_3$ exact $\Leftrightarrow M_1 \rightarrow M_2 \rightarrow M_3$ exact \square

Recall Sec. 6.4
 $R\text{-mod} \rightarrow Qcoh(\text{Spec } R)$
 $M \mapsto \tilde{M}$
 is exact and fully faithful

Claim $0 \rightarrow F_1 \rightarrow F_2 \rightarrow F_3 \rightarrow 0$ SES in $Qcoh(X)$

SES = short exact sequence
 LES = long "

\Rightarrow get LES $0 \rightarrow H^0(X, F_1) \rightarrow H^0(X, F_2) \rightarrow H^0(X, F_3) \rightarrow H^1(X, F_1) \rightarrow H^1(X, F_2) \rightarrow \dots$

$$\begin{array}{ccccccc}
 & & \Gamma(X, F_1) & & \Gamma(X, F_2) & & \Gamma(X, F_3) \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & H^0(X, F_1) & \rightarrow & H^0(X, F_2) & \rightarrow & H^0(X, F_3) \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & H^1(X, F_1) & \rightarrow & H^1(X, F_2) & \rightarrow & \dots
 \end{array}$$

(e.g. Ker measures failure of $\Gamma(X, \cdot)$ being right-exact)

Pf $0 \rightarrow F_1(U_I) \rightarrow F_2(U_I) \rightarrow F_3(U_I) \rightarrow 0$ exact by Lemma.

homological algebra:
 SES of chain complexes induces LES on cohomology (e.g. see my C3.1 notes)

$\Rightarrow 0 \rightarrow \check{C}^*(F_1) \rightarrow \check{C}^*(F_2) \rightarrow \check{C}^*(F_3) \rightarrow 0$ exact, claim follows \square

8.6 Dealing with infinite covers

A refinement of an open cover $X = \cup U_i$ is an open cover $X = \cup V_j$ s.t. $\forall j, V_j \subseteq U_i$ some i

Make choices \Rightarrow restrictions $F(U_{i(j)}) \rightarrow F(V_j) \Rightarrow \check{C}_{\{U_i\}}^*(X, F) \rightarrow \check{C}_{\{V_j\}}^*(X, F)$ chain map.

Fact $\check{H}_{\{U_i\}}^*(X, F) \rightarrow \check{H}_{\{V_j\}}^*(X, F)$ does not depend on choices made (Serre "FAC", Sec. 21)

Def $\check{H}^*(X, F) = \varinjlim \check{H}_{\{U_i\}}^*(X, F)$ (so each class is represented by a Čech cocycle for some cover, and identify cocycles if they differ by a boundary after passing to some common refinement)

Non-examinable Rmk For any topological space homotopy equivalent to a CW complex (e.g. any manifold)

$\check{H}^*(X, \underline{A}) \cong H^*(X, \mathbb{R}) =$ singular cohomology of X with coefficients in A (so for smooth manifolds, and $A = \mathbb{R}$, get de Rham cohomology)

Rmk X affine scheme \Rightarrow can use finite covers by basic affine opens, and can refine any cover by such a cover \Rightarrow can calculate $\check{H}^*(X, F)$ by only using such finite covers

Cor Theorem in 8.3 holds \forall cover (using definition \star)

Rmk X separated quasi-compact sch. \Rightarrow can calculate $\check{H}^*(X, F)$ with finite affine covers (pick finite subcover)

Cor Theorem 8.4 \Rightarrow maps in \varinjlim for such covers are isos \Rightarrow can calculate $\check{H}^*(X, F)$ with one cover! (since $\check{H}_{\{U_i\}}^*(X, F) \rightarrow \varinjlim \dots$ is iso)

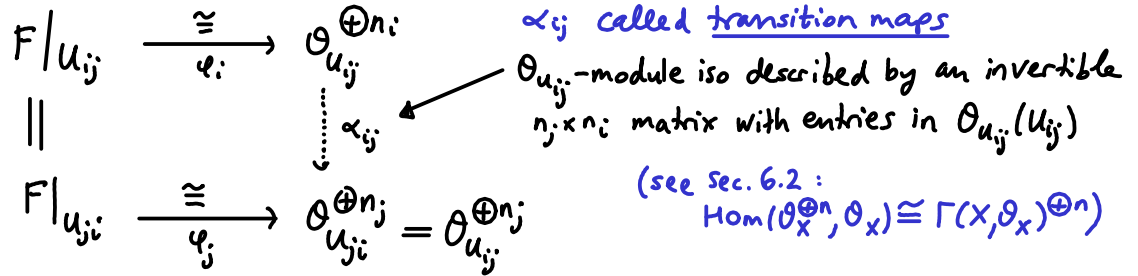

8.7 Application: line bundles and $\check{H}^1(X, \mathcal{O}_X^*)$

X scheme, $F \in \text{Vect}(X)$

$\Rightarrow \exists$ open cover $X = \cup U_i$ with $F|_{U_i} \xrightarrow{\cong \varphi_i} \mathcal{O}_{U_i}^{\oplus n_i}$ some $n_i \in \mathbb{N}$

called a trivialization over U_i

and can compare trivializations on overlaps:

$\Rightarrow n_i = n_j$ if $U_{ij} \neq \emptyset$, so the rank of F is locally constant.

Conversely, given such data φ_i, α_{ij} satisfying the cocycle condition $\alpha_{jk} \circ \alpha_{ij} = \alpha_{ik}$ on U_{ijk} determines by giving a vector bundle.

\leftarrow This is the actual definition of vector bundle in terms of compatible local trivializations.

Def $\mathcal{O}_X^* \subseteq \mathcal{O}_X$ sheaf of invertible functions. So $\mathcal{O}_X^*(U) = \{f \in \mathcal{O}_X(U) : \exists g \in \mathcal{O}_X(U) \text{ s.t. } f \cdot g = 1\}$
 Note that $\mathcal{O}_X^*(U)$ is an abelian group under multiplication.

Theorem $\{\text{isomorphism classes of line bundles that admit a trivialization over } U_i\} \xleftrightarrow{1:1} \check{H}_{\{U_i\}}^1(X, \mathcal{O}_X^*)$

and $\text{Pic}(X) \cong \check{H}^1(X, \mathcal{O}_X^*)$ as groups. \leftarrow (Pic X defined in 7.2)

Pf $\alpha_{ij} : \mathcal{O}_{U_{ij}} \rightarrow \mathcal{O}_{U_{ij}}$ given by multiplication by element $\in \mathcal{O}_{U_{ij}}^*$
 tensoring line bundles that admit a trivialization on U_{ij} : $\mathcal{O}_{U_{ij}} \cong \mathcal{O}_{U_{ij}} \otimes_{\mathcal{O}_{U_{ij}}} \mathcal{O}_{U_{ij}} \xrightarrow{\alpha_{ij} \otimes \tilde{\alpha}_{ij}} \mathcal{O}_{U_{ij}} \otimes_{\mathcal{O}_{U_{ij}}} \mathcal{O}_{U_{ij}} \cong \mathcal{O}_{U_{ij}}$
 multiplication by $\alpha_{ij} \cdot \tilde{\alpha}_{ij} \in \mathcal{O}_{U_{ij}}^*$

Cocycle condition can be rewritten: $\alpha_{jk} \cdot \alpha_{ik}^{-1} \cdot \alpha_{ij} = 1$

(which is the statement $s_{jk} - s_{ik} + s_{ij} = 0$ in multiplicative notation)

$\Rightarrow (\alpha_{ij}) \in \check{H}_{\{U_i\}}^1(X, \mathcal{O}_X^*)$

\leftarrow ($(s_i) \in \check{C}^0, d(s_i) = s_j - s_i$ on U_{ij}) in additive notation

In \check{H}^1 we identify $[(\tilde{\alpha}_{ij})] = [(\alpha_{ij})] \iff \alpha_{ij} = \tilde{\alpha}_{ij} \beta_j \beta_i^{-1}$ some $\beta_i \in \mathcal{O}_X^*$

This corresponds precisely to how the \check{C}^1 class changes under an iso of line bundles $\mathcal{L}, \tilde{\mathcal{L}}$ as in claim:

\leftarrow in the case $\mathcal{L} = \tilde{\mathcal{L}}$ the diagram shows that the \check{C}^1 class changes by a boundary chain if we change the choice of trivialization on each U_i . Hence the \check{H}^1 class does not depend on the choices of the φ_i .

Rmk \mathcal{L} line bundle with transition maps α_{ij} } and $\mathcal{L} \otimes \mathcal{L}^{-1} \cong \mathcal{O}_X =$ trivial line bundle
 $\Rightarrow \mathcal{L}^{-1}$ " " " " α_{ij}^{-1}

FACT line bundles on \mathbb{A}^n are always trivial
 indeed vector bundles on \mathbb{A}^n are always trivial \leftarrow (Serre's Conjecture 1955, Quillen-Suslin Theorem 1976)

EXAMPLE $\text{Pic}(\mathbb{P}^1)$

$$\mathbb{P}^1_k = A_0 \cup A_1$$

$$\cong \text{Spec } k[t] \cong \text{Spec } k[t^{-1}]$$

In C3.4 course: view $\mathbb{P}^1 = k^2 \setminus \{0\} / k^*$ -rescaling
 Have homogeneous coordinates $[x_0 : x_1]$
 and A_0 corresponds to $\{[1:t] : t \in \mathbb{A}^1\}$ where $t = x_1/x_0$

\mathcal{L} line bundle on $\mathbb{P}^1_k \Rightarrow \mathcal{L}|_{A_i}$ trivial since $A_i \cong \mathbb{A}^1$.

$$(\alpha_{10} : \mathcal{L}|_{A_1} \rightarrow \mathcal{L}|_{A_0}) \in k[t, t^{-1}]^* = \{a t^i : a \in k^*, i \in \mathbb{Z}\}$$

$\beta_0 \in k[t]^* = k^*, \beta_1 \in k[t^{-1}]^* = k^*$ \leftarrow note: $A_0 \cap A_1 = \text{Spec } k[t, t^{-1}]$
 exercise

$$\Rightarrow \text{Pic}(\mathbb{P}^1) \cong \check{H}^1(\mathbb{P}^1, \mathcal{O}_{\mathbb{P}^1}^*) \cong \mathbb{Z}$$

$$\Theta(i) \leftrightarrow (\alpha_{10} = t^i) \leftrightarrow i$$

so define $\Theta(i)$ by using
 $\alpha_{10} = t^i$
 $\alpha_{01} = t^{-i}$

Rmk $\Theta(0) = \mathcal{O}_{\mathbb{P}^1}$ trivial line bdle.

HWK 4 Ideal sheaf of a closed point in \mathbb{P}^1 is $\cong \Theta(1)$, for disjoint union of n closed pts get $\cong \Theta(n)$
 for order n point $(t^n) \subseteq k[t]$ get $\Theta(n)$

Non-examinable Rmk (for differential geometers): i determines the Chern class $c_1(\mathcal{L}) : i = \int_{\mathbb{P}^1} c_1(\mathcal{L})$

$T\mathbb{P}^1$ is $\Theta(2)$ since $2 = \chi(\mathbb{P}^1) = \chi(S^2)$ and $c_1(T\mathbb{P}^1) =$ Euler class of \mathbb{P}^1 , and $T^*\mathbb{P}^1 = \Theta(-2)$.

$\Theta(-1) \rightarrow \mathbb{P}^1$ is blow-up of \mathbb{C}^2 at 0 : the lines through 0 in k^2 are the fibres.

Theorem

Cultural Rmk

Symmetry is "Serre duality" for \mathbb{P}^1 :
 $\check{H}^1(\Theta(i)) \cong \check{H}^0(\Theta(-i-2))^*$
 $= \check{H}^0(\Theta(-i-2))^*$

$$\check{H}^0(\Theta(i)) \cong \check{H}^0(\Theta(-i-2))^*$$

$$1) \check{H}^0(\mathbb{P}^1, \Theta(i)) = \begin{cases} 0 & i < 0 \\ \{f \in k[t] : \deg f \leq i\} \cong k[x_0, x_1]_i & i \geq 0 \end{cases}$$

$t = x_1/x_0$ \leftarrow i -th graded part, so homogeneous polys in x_0, x_1 of degree i

$$2) \check{H}^1(\mathbb{P}^1, \Theta(i)) = \begin{cases} 0 & i \geq -1 \\ k[t^{-1}] / k + t^i k[t^{-1}] \cong k[x_0, x_1]_{-i-2} & i < -1 \end{cases}$$

exercise

$$3) \check{H}^n(\mathbb{P}^1, \Theta(i)) = 0 \text{ for } n \geq 2$$

Pf By 8.6, since \mathbb{P}^1 separated & quasi-compact, enough to calculate $\check{H}_{\{A_0, A_1\}}^*(\mathbb{P}^1, \Theta(i))$.

3) no triple ordered overlaps or higher

$$1) \check{H}^0 = \Gamma : g(t^{-1}) \in k[t^{-1}] \text{ on } A_1, f(t) \in k[t] \text{ on } A_0, \text{ on overlap: } t^i g(t^{-1}) = f(t) \in k[t, t^{-1}]$$

$\Rightarrow \deg f \leq i$ and g is determined by f from equation

example $\Theta(1)$
 $s = 1$ on A_0
 $s = t^{-1}$ on A_1
 s is global section

2) $\mathcal{L} = \Theta(i)$

$$\underbrace{\Gamma(A_0, \mathcal{L})}_{\cong k[t]} \oplus \underbrace{\Gamma(A_1, \mathcal{L})}_{\cong k[t^{-1}]} \xrightarrow{d} \underbrace{\Gamma(A_0 \cap A_1, \mathcal{L})}_{\cong k[t, t^{-1}]} \xrightarrow{d} 0$$

$$(f, g) \longmapsto t^i g(t^{-1}) - f(t)$$

$$\check{H}^1 = k[t, t^{-1}] / k[t] + t^i k[t^{-1}]$$

\leftarrow restriction of $g(t^{-1})$ to A_{01} means we must apply α_{10}

\cdot is all of $k[t, t^{-1}]$ if $i \geq -1$
 \cdot does not contain $t^{-1}, t^{-2}, \dots, t^{i+1}$ if $i < -1$

□

EXAMPLE: \mathbb{P}^n

called hyperplane bundle or Serre's twisting sheaf

$$X = \mathbb{P}_k^n = A_0 \cup A_1 \cup \dots \cup A_n$$

$$A_i = \text{Spec } k\left[\frac{x_0}{x_i}, \dots, \frac{x_n}{x_i}\right] \quad \leftarrow \text{omit } \frac{x_i}{x_i}$$

$$\theta(1) = \text{line bundle with } \alpha_{ij} = \left(\frac{x_i}{x_j}\right) : k\left[\frac{x_0}{x_i}, \dots, \frac{x_n}{x_i}, \frac{x_i}{x_j}\right] \rightarrow k\left[\frac{x_0}{x_j}, \dots, \frac{x_n}{x_j}, \frac{x_j}{x_i}\right]$$

\mathbb{P}^1 case: $t = x_1/x_0$
 $\alpha_{01}: k[t] \rightarrow k[t^{-1}]$
 is multiplication by $\frac{x_0}{x_1} = t^{-1}$ ✓

$$\theta(m) = \theta(1)^{\otimes m} \quad \text{so } \alpha_{ij} = \left(\frac{x_i}{x_j}\right)^m$$

↑
tensor m times

both equal to $\Gamma(A_i \cap A_j, \theta_x)$

Rmk $\theta(-1)$ called tautological line bundle because in C3.4 course each (closed) point of \mathbb{P}^n is a 1-dim vector subspace $V \subseteq k^{n+1}$ ($\mathbb{P}^n = k^{n+1} \setminus \{0\} / \sim$ -rescaling)
 so get obvious line bundle: over the point $[V] \in \mathbb{P}^n$ have the line V .

Hwk 4 $\text{Pic}(\mathbb{P}^n) \cong \mathbb{Z}$ generated by the $\theta(m)$

$$\Gamma(\mathbb{P}^n, \theta(m)) = \begin{cases} k[x_0, \dots, x_n]_m & \text{if } m \geq 0 \\ 0 & \text{if } m < 0 \end{cases}$$

← so homogeneous polys of deg = m
 so on A_i get polys of deg $\leq m$
 in the variables $\frac{x_0}{x_i}, \dots, \frac{x_n}{x_i}$

8.8 Product on Čech cohomology

(Non-examinable section) (X, θ_x) any ringed space

$$\check{H}_{\{U_i\}}^p(X, F) \times \check{H}_{\{U_i\}}^q(X, G) \longrightarrow \check{H}_{\{U_i\}}^{p+q}(X, F \otimes_{\theta_x} G)$$

$$((s_I), (t_I)) \longmapsto (s_I \otimes t_I)$$

Rmk In 8.6 where we took constant coefficients $F=G=\mathbb{Z}$ we recover the cup product on singular cohomology (respectively on de Rham cohomology)

← note $\mathbb{Z} \otimes_{\theta_x} \mathbb{Z} \cong \mathbb{Z}$

↑ using $F=G=\mathbb{R}$
 $\theta_x = \text{smooth real functions}$
 so $\mathbb{R} \otimes_{\theta_x} \mathbb{R} \cong \mathbb{R}$

9. Sheaf Cohomology

9.1 Resolutions

Motivation: "represent" an object in an abelian category A by "nicer objects" at the cost of using a chain cx (sec. 1.8)

right resolution of $M \in A$ means an exact sequence $0 \rightarrow M \rightarrow I^0 \rightarrow I^1 \rightarrow I^2 \rightarrow \dots$ in A
 left resolution $\dots \rightarrow P_2 \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0$, or $P_0 \rightarrow M$
 abbreviated as $M \rightarrow I^\bullet$

Def I injective if $\text{Hom}(\cdot, I)$ exact, P projective if $\text{Hom}(P, \cdot)$ exact (both always left exact)

Fact Injective resolution $M \rightarrow I^\bullet$ means I^n are injective
projective resolution $P_\bullet \rightarrow M$ " P_n " projective

$f, g: A \rightarrow B$ additive functors of abelian cats (see 1.7)

f left exact \Rightarrow right-derived functor $R^n f(M) = H^n(f(I^\bullet))$ (see 1.8)

g right exact \Rightarrow left-derived functor $L_n g(M) = H_n(g(P_\bullet))$

$M \rightarrow I^\bullet$ inj. res. \swarrow Later will see why choice of I^\bullet, P_\bullet does not matter.
 $P_\bullet \rightarrow M$ proj. res. \swarrow
 $\ker(fI^0 \rightarrow fI^1) \cong \text{Im}(fM \rightarrow fI^0)$

Warning f left exact only implies $0 \rightarrow fM \rightarrow fI^0 \rightarrow f(\text{Im}(I^0 \rightarrow I^1)) \rightarrow 0$ exact. Deduce: $R^0 f(M) \cong fM$
 Similarly $L_0 g \cong g$, so $R^0 f, L_0 g$ remember the functors f, g .

Classical Examples $A = S\text{-Mods}$, $f = \text{Hom}(M, \cdot)$ \swarrow ring \swarrow S -mod
 $\Rightarrow \text{Ext}_S^n(M, N) = (R^n f)(N) = H^n(\text{Hom}_S(M, I^\bullet))$ ($\text{Ext}_S^0(M, N) \cong \text{Hom}_S(M, N)$)
 (Similarly: $f = \text{Hom}(\cdot, N): S\text{-Mods}^{\text{op}} \rightarrow \text{Ab}$, $\text{Ext}_S^n(M, N) = (R^n f)(M) = H_n(\text{Hom}(P_\bullet, N))$
 $P_\bullet \rightarrow M$ proj. res.)

$g = M \otimes_S \cdot$ right exact $\Rightarrow \text{Tor}_S^n(M, N) = (L_n g)(N) = H_n(M \otimes_S P_\bullet)$ ($\text{Tor}_S^0(M, N) \cong M \otimes_S N$)
 (Similarly: $g = \cdot \otimes_S N$, $\text{Tor}_S^n(M, N) = (L_n g)(M) = H_n(P_\bullet \otimes_S N)$ for $P_\bullet \rightarrow M$ proj. res.)

For R -mods: I injective \Leftrightarrow if $I \subseteq$ any mod M then \exists mod $J: I \oplus J = M$ (compare linear algebra "extending a basis")
 P projective $\Leftrightarrow P$ is a direct summand of a free R -mod

Fact $M \rightarrow I^\bullet$ inj. res., $N \rightarrow J^\bullet$ inj. res., \downarrow morph \Rightarrow can extend $M \rightarrow I^\bullet \rightarrow N \rightarrow J^\bullet$ and any 2 choices \Rightarrow are chain homotopic $\Rightarrow f(M) \rightarrow H^*(f(I^\bullet)) \rightarrow f(N) \rightarrow H^*(f(J^\bullet))$ $\exists!$

Key idea I inj $\Rightarrow \text{Hom}(\cdot, I)$ right exact \Rightarrow if $A \xrightarrow{\text{mono}} B$ then any $A \rightarrow I$ can be extended to $B \rightarrow I$. E.g. $M \hookrightarrow I^\bullet \Rightarrow N \rightarrow J^\bullet$

Cor $R^n f(M) = H^n(fI^\bullet)$ independent of choice of inj. res. $M \rightarrow I^\bullet$
 Pf Apply fact to $M=N$, get $H^*(fI^\bullet) \rightarrow H^*(fJ^\bullet) \rightarrow H^*(fI^\bullet)$ composite is id by uniqueness. \square

Lemma f left exact, $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ SES $\Rightarrow \exists$ canonical & functorial LES
 $0 \rightarrow R^0 f(M_1) \rightarrow R^0 f(M_2) \rightarrow R^0 f(M_3) \rightarrow R^1 f(M_1) \rightarrow R^1 f(M_2) \rightarrow R^1 f(M_3) \rightarrow R^2 f(M_1) \rightarrow \dots$
 \parallel fM_1 \parallel fM_2 \parallel fM_3

Pf Lemma using Fact $0 \rightarrow I_1^\bullet \rightarrow I_2^\bullet \rightarrow I_3^\bullet \rightarrow 0 \Rightarrow 0 \rightarrow fI_1^\bullet \rightarrow fI_2^\bullet \rightarrow fI_3^\bullet \rightarrow 0$ now take LES induced by this SES of complexes \square
 $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0 \Rightarrow 0 \rightarrow fM_1 \rightarrow fM_2 \rightarrow fM_3 \rightarrow 0$
 where these triples are just $R^n f$ applied to the SES

Rmk Indeed $R^0 f$ satisfies universal property that $R^0 f = f$ and Lemma holds, and it follows that $R^0 f(M) = H^0(f(I^\bullet))$ for any inj. res. $M \rightarrow I^\bullet$ (see end of next section)

Hwk 4 $\text{Ab}(X)$ has enough injectives i.e. can build inj. resolutions of any object $F \in \text{Ab}(X)$.

$\Gamma(X, \cdot): \text{Ab}(X) \rightarrow \text{Ab}$ left exact \Rightarrow can define sheaf cohomology $H^n(X, F) = R^n \Gamma(X, F)$ (Sec. 1.9)

We now ask how this relates to $\check{H}^n(X, F)$ for $F \in \text{QCoh}(X) \subseteq \text{Ab}(X)$ and X scheme.

9.2 Acyclic resolutions (in an abelian cat.)

Rmk If I inj. object \Rightarrow resolution $0 \rightarrow I \xrightarrow{id} I^0 = I \rightarrow 0 \rightarrow 0 \rightarrow \dots \Rightarrow R^n f(I) = 0 \quad \forall n \geq 1$

So for sheaf cohomology: $H^n(X, I) = 0 \quad \forall n \geq 1$ if I injective sheaf.

Def An acyclic resolution of F is an exact sequence $0 \rightarrow F \rightarrow J^0 \rightarrow J^1 \rightarrow \dots$ with $H^n(X, J^k) = 0 \quad \forall n \geq 1$ ← (so we weakened the condition of being an inj. resolution)

Claim Any acyclic resolution can be used to compute sheaf cohomology, i.e.

$$H^n(X, F) = \text{cohomology of chain complex } \Gamma(X, I^0) \rightarrow \Gamma(X, I^1) \rightarrow \dots$$

Pf Trick "break down into SES and take LES":

Let $C_1 = \text{Coker}(F \rightarrow J_0) \cong \text{Im}(J_0 \rightarrow J_1)$ ← exactness so \exists natural monomorph. $C_1 \hookrightarrow J_1$
 $C_{n+1} = \text{Coker}(C_n \rightarrow J_n) \cong \text{Im}(J_n \rightarrow J_{n+1})$ " " $C_{n+1} \hookrightarrow J_{n+1}$

$$\left. \begin{array}{l} 0 \rightarrow F \rightarrow J_0 \rightarrow C_1 \rightarrow 0 \\ 0 \rightarrow C_1 \rightarrow J_1 \rightarrow C_2 \rightarrow 0 \\ 0 \rightarrow C_n \rightarrow J_n \rightarrow C_{n+1} \rightarrow 0 \end{array} \right\} \text{exact, and } 0 \rightarrow F \rightarrow J_0 \rightarrow J_1 \rightarrow J_2 \rightarrow J_3 \rightarrow \dots$$

$\begin{array}{c} \downarrow \quad \uparrow \quad \downarrow \quad \uparrow \\ C_1 \quad C_2 \quad \dots \end{array}$

Technical Lemma $0 \rightarrow F \rightarrow I \rightarrow G \rightarrow 0$ SES $\Rightarrow H^n(F) \cong H^{n-1}(G) \quad n \geq 2$
 (only uses LES in H^*) with $H^n(I) = 0 \quad n \geq 1$ $H^1(F) \cong \text{Coker}(H^0 I \rightarrow H^0 G)$

Pf $0 \rightarrow H^0 F \rightarrow H^0 I \xrightarrow{\otimes} H^0 G \rightarrow H^1(F) \rightarrow H^1(I) \rightarrow H^1(G) \rightarrow H^2(F) \rightarrow H^2(I) \rightarrow \dots \square$
↑ so surj. so $H^1 F = \text{Coker} \otimes$ || 0 ↑ so \cong || 0

Finish proof, abbreviate $H^n(F) = H^n(X, F)$, $\Gamma(F) = \Gamma(X, F)$:

$$H^n(F) \cong H^{n-1}(C_1) \cong H^{n-2}(C_2) \cong \dots \cong H^1(C_{n-1}) \cong \text{Coker}(H^0(J_{n-1}) \rightarrow H^0(C_n))$$

Γ left exact
 exactness of:
 $0 \rightarrow \Gamma(C_n) \xrightarrow{in} \Gamma(J_n) \xrightarrow{p_n} \Gamma(C_{n+1})$
 hence inj. $\text{Ker } p_n = \text{Im } in$

$$\left. \begin{array}{l} \dots \rightarrow \Gamma(J_{n-1}) \xrightarrow{\alpha_{n-1}} \Gamma(J_n) \xrightarrow{\alpha_n} \Gamma(J_{n+1}) \rightarrow \dots \\ \parallel \quad \parallel \quad \parallel \\ H^0(J_{n-1}) \xrightarrow{p_{n-1}} \Gamma(C_n) \xrightarrow{p_n} \Gamma(C_{n+1}) \\ \parallel \quad \parallel \\ H^0(C_n) \end{array} \right\} \begin{array}{l} \text{Ker } \alpha_n / \text{Im } \alpha_{n-1} \\ = \text{Ker } p_n / \text{Im } in \circ p_{n-1} \\ = \text{Im } in / \text{Im } in \circ p_{n-1} \\ \cong \Gamma(C_n) / \text{Im } p_{n-1} \\ = \text{Coker } p_{n-1} \\ = H^n(F). \end{array}$$

via in

Non-examinable:

Rmk For a left-exact functor $f: A \rightarrow B$ of abelian cats, a resolution $0 \rightarrow M \rightarrow I^\bullet$ is f -acyclic if $R^n(f(I^k)) = 0 \quad \forall n \geq 1$. Similarly for right exact functors g , for $P_\bullet \rightarrow M \rightarrow 0$ says $L_n(g(P_k)) = 0 \quad \forall n \geq 1$.

Fact Injective resolutions are acyclic resolutions for left exact functors
 projective " " " " right " "

9.3 Čech cohomology vs sheaf cohomology

Theorem X separated, quasi-compact scheme. Suppose $H^n: \text{QCoh}(X) \rightarrow \text{Ab}$ are functors s.t.

i) $H^0(X, F) = \Gamma(X, F)$.

ii) $\varphi: U \hookrightarrow X$ affine open $\Rightarrow H^n(X, \varphi_* F) = 0 \quad \forall n \geq 1, \forall F \in \text{QCoh}(U)$. ← $\in \text{QCoh}(X)$ by Sec. 7.4 Rmk

iii) SES induces a LES on H^*

Then $H^* \cong \check{H}^*$

holds for Čech cohomology since
 $\check{H}^n_{\{U_i\}}(X, \varphi_* F) = \check{H}^n_{\{\varphi^{-1}U_i\}}(\varphi^{-1}X, F) = \check{H}^n_{\{U_i\}}(U, F) \stackrel{U \text{ affine}}{=} 0, n \geq 1$

Pf $X = \cup U_i$: finite affine open cover (use X quasi-compact)

U_I affine since X separated (using ordered I)

Notice that the Čech complex

$$\check{C}^n = \prod_{|I|=n} F(U_I) = \prod_{|I|=n} \Gamma(U_I, F) = \prod_{|I|=n} \Gamma(X, \varphi_{I*}(F|_{U_I})) = \Gamma(X, \prod_{|I|=n} \varphi_{I*}(F|_{U_I}))$$

where $\varphi_I: U_I \hookrightarrow X$ is the inclusion

$$\Rightarrow \check{C}^n = \Gamma(X, J^n) \text{ and have sequence } 0 \rightarrow F \rightarrow J^0 \rightarrow J^1 \rightarrow \dots$$

call this J^n

By Sec. 9.2 it is enough to check this is an acyclic resolution, since then

use restriction maps $F \rightarrow \varphi_{I*}(F|_{U_I})$
other maps are defined on any open $V \subseteq X$ by the Čech differential on V for cover $V \cap U_I$

$$H^n(X, F) \cong H^n(\Gamma(X, J^\bullet)) = H^n(\check{C}_{\{U_i\}}^\bullet(X, F)) = \check{H}^n(X, F)$$

By (iii): $H^n(X, \varphi_{I*}(F|_{U_I})) = 0 \quad \forall n \geq 1$

$\prod_{|I|=n}$ is a finite product so \cong finite \oplus . So $H^n(X, J^k) = 0 \quad \forall n \geq 1$ follows by induction by:

Trick If $G_1, G_2 \in \text{QCoh } X$, $H^n(X, G_i) = 0 \quad \forall n \geq 1 \Rightarrow G_1 \oplus G_2$ also, since:

$$0 \rightarrow G_1 \rightarrow G_1 \oplus G_2 \rightarrow G_2 \rightarrow 0 \text{ SES} \xRightarrow{(iii)} \text{take LES get } H^n(X, G_1 \oplus G_2) = 0, n \geq 1 \checkmark$$

$$0 \rightarrow F \rightarrow J^0 \text{ exact} \Leftrightarrow \text{exact on stalks} \Leftrightarrow 0 \rightarrow \Gamma(U, F) \rightarrow \Gamma(U, J^0) \text{ exact } \forall \text{ affine open } U$$

$$0 \rightarrow \Gamma(U, F) \rightarrow \Gamma(U, J_0) \rightarrow \Gamma(U, J_1) \rightarrow \dots$$

exact since $\Gamma(U, \cdot)$ left exact (Sec. 1.9)

exact since $\check{H}^n(U, F) = 0$ for $n \geq 1$
for cover $U \cap U_i$:
since U affine, using sec. 8.3 \square

stronger than quasi-compact

Cor X separated, Noetherian \Rightarrow sheaf cohomology $H^n(X, F) \cong \check{H}^n(X, F) \quad \forall F \in \text{QCoh}(X)$

Non-examinable

Pf Sheaf cohomology $H(X, F) =$ cohomology of $\Gamma(X, I^0) \rightarrow \Gamma(X, I^1) \rightarrow \dots$ for $F \rightarrow I^\bullet$ any injective resolution.
Check the conditions of Theorem:

i) $\Gamma(X, \cdot)$ left exact $\Rightarrow H^0(X, F) \cong \Gamma(X, F)$

general consequence see 9.1, or explicitly:
 $0 \rightarrow \Gamma(X, F) \rightarrow \Gamma(X, I^0) \rightarrow \Gamma(X, I^1)$
exact, so $\text{im } \uparrow$ is ker of \uparrow which is H^0

iii) Lemma in 9.1 proves \exists LES

ii) by the Theorem below. \square

Theorem R Noeth., $F \in \text{QCoh}(\text{Spec } R) \Rightarrow H^n(\text{Spec } R, F) = 0 \quad \forall n \geq 1$

Cultural Rmk
Serre's Theorem:
 X Noeth. scheme then:
 X affine $\Leftrightarrow H^n(X, F) = 0$
 $\forall n \geq 1$
 $\forall F \in \text{QCoh}(X)$

Non-examinable proof ideas The cleanest proof is to build machinery:

- 1) A sheaf F is flasque if all restrictions $F(U) \rightarrow F(V)$ are surjective.
- 2) \forall flasque F on a top. space X , have $H^n(X, F) = 0 \quad \forall n \geq 1$ (Hartshorne III.2.5)
- 3) \forall injective R -module I , and R Noeth. $\Rightarrow \tilde{I}$ on $\text{Spec } R$ is flasque (Hartshorne III.3.4)

Cor Flasque resolutions are acyclic by (2), so can be used to compute $H^n(X, F)$ by 9.2

Pf Thm $F \cong \tilde{M}$ for $M = \Gamma(X, F)$ by 7.6. Pick injective resolution of the R -module M : $0 \rightarrow M \rightarrow I^\bullet$

$\Rightarrow 0 \rightarrow \tilde{M} \rightarrow \tilde{I}^\bullet$ exact, each \tilde{I}^n flasque, so can use this to compute $H^n(X, F)$ by Cor

$\Rightarrow H^n(X, \tilde{M}) = H^n(\Gamma(X, \tilde{I}^\bullet)) = H^n(I^\bullet) \stackrel{\cong}{=} 0$ since I^\bullet exact sequence except in degree 0. \square

(in deg=0 get M , and $H^0(X, \tilde{M}) = \tilde{M}(X) = M$)

Rmk Injective \mathcal{O}_X -mods are flasque (Hartshorne III.2.4)

9.4 Product on sheaf cohomology

(Non-examinable section) (X, \mathcal{O}_X) any ringed space

Fact \exists product $H^p(X, F) \times H^q(X, G) \longrightarrow H^{p+q}(X, F \otimes_{\mathcal{O}_X} G)$

idea
$$\begin{array}{c} 0 \rightarrow F \rightarrow I^\bullet \\ 0 \rightarrow G \rightarrow J^\bullet \end{array} \Rightarrow 0 \rightarrow F \otimes G \rightarrow I^\bullet \otimes J^\bullet$$
 unfortunately not a resolution
← bi-complex (compare 8.4) with maps $d \otimes \text{id}, \text{id} \otimes d$
then take total complex: total degree is sum of degrees

rows & cols not exact

(e.g. degree 2 part is $(I^2 \otimes J^0) \oplus (I^1 \otimes J^1) \oplus (I^0 \otimes J^2)$)

need I^\bullet, J^\bullet to be "pure acyclic resolutions" to ensure this →

is resolution. Then given any inj. res. $F \otimes G \rightarrow K^\bullet$,
the identity $F \otimes G \xrightarrow{\text{id}} F \otimes G$ extends to $I^\bullet \otimes J^\bullet \rightarrow K^\bullet$.

Taking $\Gamma(X, \cdot)$ yields the result. (see key idea under the Fact in 9.1)

10. QCoh(\mathbb{P}^n), graded modules, Proj R

(Non-examinable chapter)

Def graded ring means a ring R s.t.

$R = R_0 \oplus R_1 \oplus R_2 \oplus \dots$ as abelian groups

$R_i \cdot R_j \subseteq R_{i+j}$

so graded by \mathbb{N}

Rmk R_0 is ring by

The elements of R_n are called homogeneous elements of degree n

Graded module means R-mod M s.t.

$M = \dots \oplus M_{-2} \oplus M_{-1} \oplus M_0 \oplus M_1 \oplus M_2 \oplus \dots$ as abelian groups

$R_i \cdot M_j \subseteq M_{i+j}$

so graded by \mathbb{Z}

A morphism of graded R-mods is R-mod hom $M \xrightarrow{\varphi} N$, with $\varphi(M_n) \subseteq N_n \quad \forall n$

$X = \mathbb{P}_k^n = A_0 \cup A_1 \cup \dots \cup A_n$
 $A_i = \text{Spec } k[\frac{x_0}{x_i}, \dots, \frac{x_n}{x_i}]$ omit $\frac{x_i}{x_i}$
 $= \text{Spec}((k[x_0, \dots, x_n]_{x_i})_0)$
 $A_i \cap A_j = \text{Spec } k[\frac{x_0}{x_i}, \dots, \frac{x_n}{x_i}, \frac{x_i}{x_j}]$ means take 0-th graded part
 $= \text{Spec}((k[x_0, \dots, x_n]_{x_i x_j})_0)$
 recall in C3.4 the 0-graded part is the part which gives well-defined functions (invariant under k^* -rescaling)

From now on : $R = k[x_0, \dots, x_n]$ $R_m =$ homogeneous polys of deg = m (so $R_0 = k$)

Claim \exists {graded R-mods} \longrightarrow QCoh(\mathbb{P}^n) exact, full & faithful

$M \longmapsto \tilde{M}$

Pf Let $M_i = (M_{x_i})_0$ and $M_{ij} = (M_{x_i x_j})_0$

0-th graded piece

$((M_{x_i})_0)_{\frac{x_j}{x_i}} \cong (M_{x_i x_j})_0$

Define $\tilde{M}|_{A_i} = \tilde{M}_i$ these glue since $\tilde{M}_i|_{A_i \cap A_j} \cong \tilde{M}_{ij} \cong \tilde{M}_j|_{A_i \cap A_j}$

Exactness is a local condition, so it holds since it holds in affine case.

Full & faithful : $\text{Hom}(\tilde{M}|_{A_i}, \tilde{N}|_{A_i}) = \text{Hom}(\tilde{M}_i, \tilde{N}_i) = \text{Hom}_{(R_{x_i})_0\text{-mods}}((M_{x_i})_0, (N_{x_i})_0)$

this reduces the problem to an exercise in graded R-mods. (omitted here) \square

Warning Not an equivalence of categories because:

Hwk 4 if $M_n = N_n$ for $n \gg N$ then $\tilde{M} \cong \tilde{N}$

so a graded hom that's bijective in large degrees

Fact If work with graded R-mods "modulo" identifying those which eventually agree in large grading, then get equivalence with inverse

and $\text{Coh}(\mathbb{P}^n) \rightarrow \text{QCoh}(\mathbb{P}^n) \ni F \longmapsto \bigoplus_{d \geq 0} \Gamma(\mathbb{P}^n, F(d))$ where $F(d) = F \otimes_{\mathcal{O}_{\mathbb{P}^n}} \mathcal{O}(d)$ ← called twisting

corresponds to f.g. graded mods

In particular

$F \cong \bigoplus_{d \geq 0} \Gamma(\mathbb{P}^n, F(d))$

Def $M[d]$ new graded R-mod with $M[d]_i = M_{d+i}$

Example $\mathcal{L} := \widetilde{R[d]}$ on \mathbb{P}^n ← (so $k[x_0, \dots, x_n][d]$)

$\mathcal{L}(A_i) = (R[d]_{x_i})_0 \cong x_i^d k[\frac{x_0}{x_i}, \dots, \frac{x_n}{x_i}] = x_i^d \cdot (R_{x_i})_0$

line bundle with $\alpha_{ij} = (x_i/x_j)^d$. Hence $\mathcal{L} = \mathcal{O}(d)$.

$(\mathcal{O}_{\mathbb{P}^n}|_{A_i}) \cong \mathcal{L}|_{A_i} \cong \mathcal{L}|_{A_j} \cong \mathcal{O}_{\mathbb{P}^n}|_{A_j}$, $f \mapsto x_i^d f \mapsto x_j^{-d} x_i^d f$

Exercise $\widetilde{M[d]} \cong \tilde{M}(d) (= \tilde{M} \otimes_{\mathcal{O}_{\mathbb{P}^n}} \mathcal{O}(d))$ ← (e.g. $\widetilde{R[d]} = \tilde{R}(d) (= \mathcal{O}_{\mathbb{P}^n} \otimes_{\mathcal{O}_{\mathbb{P}^n}} \mathcal{O}(d) = \mathcal{O}(d))$)

Rmk $k[x_0, \dots, x_n] = \bigoplus_{d \geq 0} \Gamma(\mathbb{P}^n, \mathcal{O}(d))$ (but this does not generalise due to above issue about cats)

The construction of \tilde{M} is so similar to the Spec R case of \tilde{M} , because \exists analogue of Spec R: Proj R

so shift the module down by m:

	-1	0	1	2	...
M	...	M_0	M_1	M_2	...
$M[1]$...	M_0	M_1	M_2	...

so line bundle, since on each A_i have $(R_{x_i})_0 \cong \mathcal{L}(A_i)$, $1 \mapsto x_i^d$
 Note $\mathcal{O}_{\mathbb{P}^n}(A_i) = (R_{x_i})_0$ (see box at top of page)
 and $\mathcal{L}|_{A_i} = \widetilde{R[d]}(A_i)$, $\mathcal{O}_{\mathbb{P}^n}|_{A_i} = \mathcal{O}_{\mathbb{P}^n}(A_i)$
 $\Rightarrow \mathcal{O}_{\mathbb{P}^n}|_{A_i} \cong \mathcal{L}|_{A_i}$

← or "homogeneous"

$$\text{Proj}(R) = \left\{ \begin{array}{l} \text{graded prime ideals } I \subseteq R \text{ not containing the irrelevant ideal} \\ \uparrow \\ \text{means } I = \bigoplus_{n \geq 0} (I \cap R_n) \\ \left(\Leftrightarrow \text{generated by homogeneous elts} \right) \end{array} \right\}$$

R any graded ring

$$R_+ := \bigoplus_{n > 0} R_n$$

in \mathbb{P}^n we remove the max ideal (x_0, \dots, x_n) (irredundant ideal) because don't allow the closed point $[0: \dots : 0]$

$$\mathbb{V}(I) = \{ p \in \text{Proj } R : p \supseteq I \} \quad \text{define Zariski topology}$$

f homogeneous of degree $> 0 \Rightarrow D_f = \text{Proj } R \setminus \mathbb{V}(f) = \{ p \in \text{Proj } R : f \notin p \}$ basis of open sets

Warning $\text{Proj } R = \bigcup D_f \Leftrightarrow R_+ \subseteq \sqrt{\langle \text{all } f_i \rangle}$

Fact $D_f \cong \text{Spec}((R_f)_0)$ as topological spaces

$$p \mapsto p R_f \cap (R_f)_0 \quad (\text{inverse map: } p_0 \mapsto \bigoplus_{k \geq 0} \{ a_k \in R_k : \frac{a_k \deg(f)}{f^k} \in p_0 \})$$

Sheaf $\mathcal{O} := \mathcal{O}_{\text{Proj}(R)}$:

$$\mathcal{O}|_{D_f} = \mathcal{O}_{\text{Spec}((R_f)_0)} \quad \text{then glue.}$$

← more generally, suffices $\sqrt{\varphi(R_+) \cdot S} = S_+$

Warning Proj is not functorial like Spec

If $\varphi: R \rightarrow S$ graded hom of rings, $\varphi(R_+) \supseteq S_+$ then get morph $\varphi^\#: \text{Proj } S \rightarrow \text{Proj } R$ but not all morphs arise in this way.

Examples ← any ring

1) $S = R[x_0, \dots, x_n]$ with usual grading $\Rightarrow \text{Proj } R = \mathbb{P}_R^n$ (or $\mathbb{P}_{\text{Spec } R}^n$)

2) $R^{(d)} := \bigoplus_{n \geq 0} R_{d+n}$ then the inclusion $R^{(d)} \rightarrow R$ induces an iso $\text{Proj } R \cong \text{Proj } R^{(d)}$

3) S graded ring generated as an S_0 -algebra by $n+1$ elements $s_0, \dots, s_n \in S_1$
 $\Rightarrow S_0[x_0, \dots, x_n] \xrightarrow{\varphi} S \Rightarrow S \cong \frac{S_0[x_0, \dots, x_n]}{\text{Ker } I} \Rightarrow \text{Proj } S \cong \mathbb{V}(I) \subseteq \mathbb{P}_{S_0}^n$
 closed subscheme

Example $k[x, y]^{(2)} = k[x^2, xy, y^2]$

$$k[X, Y, Z] \twoheadrightarrow k[x^2, xy, y^2], \quad X \mapsto x^2, Y \mapsto xy, Z \mapsto y^2$$

$\Rightarrow \mathbb{P}^1 = \text{Proj } k[x, y] \cong \text{Proj } k[x, y]^{(2)} \cong \text{Proj } k[X, Y, Z]/(XZ - Y^2)$ closed subscheme of \mathbb{P}^2

is the Veronese embedding $v_2: \mathbb{P}^1 \hookrightarrow \mathbb{P}^2$. Similarly get $v_d: \mathbb{P}^n \hookrightarrow \mathbb{P}^N$
 $N = \# \text{degree } d \text{ monomials in } x_0, \dots, x_n$
 so $N = \binom{n+d}{d}$

4) every closed subscheme of $\text{Proj } R$ arises as $\text{Proj}(R/I)$ some graded ideal I.

Fact $R = \bigoplus_{n \geq 0} R_n$ graded ring \Rightarrow line bundles $\mathcal{O}(d) = \widetilde{R}_d$ on $\text{Proj } R$, and

$$\{ \text{graded } R\text{-mods} \} \rightarrow \text{QCoh}(\text{Proj } R)$$

$$M \mapsto \widetilde{M}$$

$$\Gamma_0(F) \longleftarrow F$$

$$\text{where } \Gamma_d(F) := \Gamma(\text{Proj } R, F(d))$$

again, not an equivalence of cats, but $\widetilde{\Gamma_0(F)} \cong F$.

← (if $M_n \cong N_n$ for $n \geq N$ then $\widetilde{M} \cong \widetilde{N}$.)

← (if identify modules that "eventually agree" then get equivalence)

← Note: this tells us $\text{QCoh}(\cdot)$ for any projective variety!

$$\begin{pmatrix} F(d) = F \otimes_{\mathcal{O}_X} \mathcal{O}(d) \\ \mathcal{O}_X = \widetilde{R} \text{ on } X = \text{Proj } R \end{pmatrix}$$

and $\text{Coh}(\text{Proj } R)$ corresponds to the f.g. graded R -mods
