

## **Gödel's Incompleteness Theorems Revision, and past exam papers**

The syllabus is defined by the lectures and the problem sheets: so things that did not appear in either the lectures or in the problem sheets are not on the syllabus.

This means that (with regret) some things that were on the syllabus in previous years, are not on the syllabus this year.

So past exam papers should be used as an aid to revision, but with that caveat in mind.

This year, because of the Covid-19 epidemic, exams and (it looks overwhelmingly likely) teaching also, will be done remotely. This is not ideal. There are foreseeable problems, and no doubt there will be problems that won't have been foreseen. But it seems to be the best that can be done under the circumstances. This will also mean that consultation sessions will have to be done remotely. I anticipate that it will be more difficult for me to respond to questions, and very difficult, or impossible, to respond to questions that people do not explicitly ask (so looking puzzled won't get you any response). It will therefore be very helpful if you let me know in advance what questions you might be hoping to bring up in a consultation session, and I can try to shape the session accordingly.

Oh, and I should mention a foreseeable problem. Where I live, we sometimes get power cuts. So I may abruptly disappear halfway through a session, and be unable to reconnect for anywhere from minutes to hours.
