

# Further Partial Differential Equations

## Problem Sheet 4

Figure 1: Normalised temperature  $u$  and liquid fraction  $\theta$  versus enthalpy  $h$ .

### 1. Enthalpy for mushy layers

Show that the free boundary problem (2.31) may be posed as

$$\frac{\partial h}{\partial t} = \frac{\partial^2 u}{\partial x^2} + q,$$

where  $h = Stu + \theta$  is the (dimensionless) *enthalpy*. Deduce that  $u$  is a piecewise linear function of  $h$ , as indicated in figure 1.

## 2. Unsteady electropainting

Consider the unsteady version of the model problem depicted in Figure 2.9, i.e., with the conditions on  $y = 0$  replaced by

$$\begin{aligned} \frac{\partial \phi}{\partial y} &= \frac{\phi}{h}, & \frac{\partial h}{\partial t} &= \frac{\partial \phi}{\partial y} - \delta & y = 0, \quad |x| < c, \\ \phi &= 0 & & & y = 0, \quad |x| > c, \end{aligned}$$

where now  $c = c(t)$ . Find the small-time behaviour of the solution by expanding

$$\begin{aligned} \phi(x, y, t) &\sim \phi_0(x, y) + t\phi_1(x, y) + \cdots, \\ h(x, t) &\sim th_1(x) + t^2h_2(x) + \cdots, \\ c(t) &\sim c_0 + tc_1 + \cdots. \end{aligned}$$

Show that painting commences provided  $\delta < 1/\pi$ , in which case the layer initially grows over a half-width  $c_0 = \sqrt{1/(\delta\pi) - 1}$ .

### 3. One-dimensional welding

- (a) Consider the dimensionless one-dimensional welding problem (2.31). Show that, before melting occurs, the solution is given by

$$u(x, t) = -1 + \frac{q}{2} (1 - x^2) + \sum_{n=0}^{\infty} c_n \cos \left[ \left( n + \frac{1}{2} \right) \pi x \right] e^{-(n+\frac{1}{2})^2 \pi^2 t / \text{St}}$$

and use Fourier series to evaluate the constants  $c_n$ .

- (b) Deduce that the sample will eventually melt provided  $q > 2$ , at a time  $t_m$  that satisfies

$$q = \left( \frac{1}{2} - 2 \sum_{n=0}^{\infty} \frac{(-1)^n e^{-(n+\frac{1}{2})^2 \pi^2 t_m / \text{St}}}{(n + \frac{1}{2})^3 \pi^3} \right)^{-1}. \quad (1)$$

- (c) Show that the leading-order asymptotic dependence of equation (1) between  $t_m / \text{St}$  and  $q$  is

$$\begin{aligned} \frac{t_m}{\text{St}} &\sim \frac{1}{q} & \text{as } t_m / \text{St} \rightarrow 0, \\ \frac{t_m}{\text{St}} &\sim \frac{4}{\pi^2} \log \left( \frac{64}{\pi^3 (q - 2)} \right) & \text{as } t_m / \text{St} \rightarrow \infty. \end{aligned}$$

- (d) For  $t > t_m$ , consider the free boundary problem (2.31). Explain why  $s_2(t) = 0$  until  $t = t_m + 1/q$ .

- (e) Now consider the limit  $\text{St} \rightarrow 0$ . Show that the plate will have melted entirely to a depth  $x = 1 - \sqrt{2/q}$  (so the mush has disappeared) after a time  $t_c \sim t_m + 1/q + O(\text{St})$ .

- (f) Show that the subsequent leading-order behaviour of the solid-liquid free boundary  $x = s(t)$  is governed by

$$\frac{ds}{dt} = \frac{q}{2} (1 + s) - \frac{1}{1 - s}, \quad s(t_c) = 1 - \sqrt{\frac{2}{q}}.$$

- (g) Deduce that the solid ahead of the free boundary is not superheated, and that the system approaches a steady state with the plate melted to a depth  $x = \sqrt{1 - 2/q}$ .
