Lemma

Suppose that $f: U \to \mathbb{C}$ is a meromorphic and has a zero of order k or a pole of order k at $z_0 \in U$. Then f'(z)/f(z) has a simple pole at z_0 with residue k or -k respectively.

Lemma

Suppose that $f: U \to \mathbb{C}$ is a meromorphic and has a zero of order k or a pole of order k at $z_0 \in U$. Then f'(z)/f(z) has a simple pole at z_0 with residue k or -k respectively.

Proof.

If f(z) has a pole of order k we have $f(z) = (z - z_0)^{-k}g(z)$ where g(z) is holomorphic near z_0 and $g(z_0) \neq 0$.

Lemma

Suppose that $f: U \to \mathbb{C}$ is a meromorphic and has a zero of order k or a pole of order k at $z_0 \in U$. Then f'(z)/f(z) has a simple pole at z_0 with residue k or -k respectively.

Proof.

If f(z) has a pole of order k we have $f(z) = (z - z_0)^{-k}g(z)$ where g(z) is holomorphic near z_0 and $g(z_0) \neq 0$.

It follows that

$$f'(z)/f(z) = \frac{-k}{z-z_0} + g'(z)/g(z),$$

Lemma

Suppose that $f: U \to \mathbb{C}$ is a meromorphic and has a zero of order k or a pole of order k at $z_0 \in U$. Then f'(z)/f(z) has a simple pole at z_0 with residue k or -k respectively.

Proof.

If f(z) has a pole of order k we have $f(z) = (z - z_0)^{-k}g(z)$ where g(z) is holomorphic near z_0 and $g(z_0) \neq 0$.

It follows that

$$f'(z)/f(z) = \frac{-k}{z-z_0} + g'(z)/g(z),$$

Since $g(z) \neq 0$ near z_0 , g'(z)/g(z) is holomorphic near z_0 so the result follows. The case where *f* has a zero at z_0 is similar.

Remark Note that if U is an open set on which one can define a holomorphic branch L of [Log(z)] then g(z) = L(f(z)) has g'(z) = f'(z)/f(z).

▲□▶▲□▶▲□▶▲□▶ = のへで

Remark Note that if U is an open set on which one can define a holomorphic branch L of [Log(z)] then g(z) = L(f(z)) has g'(z) = f'(z)/f(z).

Thus integrating f'(z)/f(z) along a path γ will measure the change in argument around the origin of the path $f(\gamma(t))$.

Remark Note that if U is an open set on which one can define a holomorphic branch L of [Log(z)] then g(z) = L(f(z)) has g'(z) = f'(z)/f(z).

Thus integrating f'(z)/f(z) along a path γ will measure the change in argument around the origin of the path $f(\gamma(t))$.

We will show using the residue theorem how to relate this to the number of zeros and poles of f inside γ :

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● の < @

Theorem

(Argument principle): Suppose that U is an open set and $f: U \to \mathbb{C}$ is a meromorphic function on U. If $B(a, r) \subseteq U$ and N is the number of zeros (counted with multiplicity) and P is the number of poles (again counted with multiplicity) of f inside B(a, r) and f has neither on $\partial B(a, r)$ then

$$m{N}-m{P}=rac{1}{2\pi i}\int_{\gamma}rac{f'(z)}{f(z)}dz,$$

where $\gamma(t) = a + re^{2\pi i t}$ is a path with image $\partial B(a, r)$. Moreover this is the winding number of the path $\Gamma = f \circ \gamma$ about the origin.

▲□▶▲□▶▲□▶▲□▶ □ の�?

Proof. Clearly $I(\gamma, z)$ is 1 if $|z - a| \le 1$ and is 0 otherwise.

◆□▶ ◆□▶ ◆ 三▶ ◆ 三▶ ○ 三 ○ ○ ○ ○

.

Clearly $I(\gamma, z)$ is 1 if $|z - a| \le 1$ and is 0 otherwise. Recall that by the residue theorem

$$\frac{1}{2\pi i}\int_{\gamma}g(z)dz=\sum_{z_0\in\mathcal{S}}\operatorname{Res}_{z_0}(g)\cdot I(\gamma,z_0),$$

where the sum ranges over the poles z_0 of g inside γ .

Clearly $I(\gamma, z)$ is 1 if $|z - a| \le 1$ and is 0 otherwise. Recall that by the residue theorem

$$\frac{1}{2\pi i}\int_{\gamma} g(z)dz = \sum_{z_0\in S} \overset{k \circ \gamma - k}{\operatorname{Res}_{z_0}(g)} \cdot I(\gamma, z_0),$$

where the sum ranges over the poles z_0 of g inside γ .

By the previous lemma f'(z)/f(z) has simple poles exactly at the zeros and poles of *f* with residues the corresponding orders. So the result follows (take g(z) = f'(z)/f(z)).

Clearly $I(\gamma, z)$ is 1 if $|z - a| \le 1$ and is 0 otherwise. Recall that by the residue theorem

$$\frac{1}{2\pi i}\int_{\gamma}g(z)dz=\sum_{z_0\in\mathcal{S}}\operatorname{Res}_{z_0}(g)\cdot I(\gamma,z_0),$$

where the sum ranges over the poles z_0 of g inside γ .

By the previous lemma f'(z)/f(z) has simple poles exactly at the zeros and poles of f with residues the corresponding orders. So the result follows (take g(z) = f'(z)/f(z)).

For the last part, note that $2\pi i \cdot I(f \circ \gamma, 0)$ is just

$$\int_{f\circ\gamma} dw/w = \int_0^1 \frac{1}{f(\gamma(t))} f'(\gamma(t))\gamma'(t)dt = \int_\gamma \frac{f'(z)}{f(z)} dz.$$

▲□▶▲□▶▲□▶▲□▶ □ のへで

Remark

The argument principle also holds, with the same proof, to any closed path γ on which f is continuous and non-vanishing, provided it has winding number +1 around its inside.

Remark

The argument principle also holds, with the same proof, to any closed path γ on which f is continuous and non-vanishing, provided it has winding number +1 around its inside.

Theorem

(Rouché's theorem): Suppose that f and g are holomorphic functions on an open set U in \mathbb{C} and $\overline{B}(a, r) \subset U$. If |f(z)| > |g(z)| for all $z \in \partial B(a, r)$ then f and f + g have the same number of zeros in B(a, r) (counted with multiplicities).

Let $\gamma(t) = a + re^{2\pi i t}$ be a parametrization of the boundary circle of B(a, r). Note that $f(z) \neq 0$ on γ since |f(z)| > |g(z)|.

Let $\gamma(t) = a + re^{2\pi i t}$ be a parametrization of the boundary circle of B(a, r). Note that $f(z) \neq 0$ on γ since |f(z)| > |g(z)|.

Consider h = (f + g)/f = 1 + g/f. By hypothesis

$$|h(z) - 1| = |g(z)/f(z)| < 1$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● の < @

for all $z \in \gamma^*$.

Let $\gamma(t) = a + re^{2\pi i t}$ be a parametrization of the boundary circle of B(a, r). Note that $f(z) \neq 0$ on γ since |f(z)| > |g(z)|.

Consider h = (f + g)/f = 1 + g/f. By hypothesis

$$|h(z) - 1| = |g(z)/f(z)| < 1$$

for all $z \in \gamma^*$.

So $\Gamma(t) = h(\gamma(t))$ is contained in the half-plane $\{z : \Re(z) > 0\}$.

Let $\gamma(t) = a + re^{2\pi i t}$ be a parametrization of the boundary circle of B(a, r). Note that $f(z) \neq 0$ on γ since |f(z)| > |g(z)|.

Consider h = (f + g)/f = 1 + g/f. By hypothesis

$$|h(z) - 1| = |g(z)/f(z)| < 1$$

for all $z \in \gamma^*$.

So $\Gamma(t) = h(\gamma(t))$ is contained in the half-plane $\{z : \Re(z) > 0\}$. Picking a branch of Log defined on this half-plane:

$$\int_{\Gamma} \frac{dz}{z} = \operatorname{Log}(h(\gamma(1)) - \operatorname{Log}(h(\gamma(0))) = 0$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● の < @

Let $\gamma(t) = a + re^{2\pi i t}$ be a parametrization of the boundary circle of B(a, r). Note that $f(z) \neq 0$ on γ since |f(z)| > |g(z)|.

Consider h = (f + g)/f = 1 + g/f. By hypothesis

$$|h(z) - 1| = |g(z)/f(z)| < 1$$

for all $z \in \gamma^*$.

So $\Gamma(t) = h(\gamma(t))$ is contained in the half-plane $\{z : \Re(z) > 0\}$. Picking a branch of Log defined on this half-plane:

$$\int_{\Gamma} \frac{dz}{z} = \operatorname{Log}(h(\gamma(1)) - \operatorname{Log}(h(\gamma(0))) = 0$$

By the argument principle h = (f + g)/f has the same number of zeros as poles. As the number of poles is the number of zeros of *f* and the number of zeros is the number of zeros of f + g the theorem follows.

Remark

Rouché's theorem can be useful in counting the number of zeros of a function f – one tries to find an approximation to f whose zeros are easier to count and then by Rouché's theorem obtain information about the zeros of f. Just as for the argument principle above, Rouché's theorem also holds for closed paths which winding number 1 about their inside.

Show that all the roots of $P(z) = z^4 + 5z + 2$ have modulus less than 2.

Show that all the roots of $P(z) = z^4 + 5z + 2$ have modulus less than 2.

On the circle |z| = 2, we have $|z|^4 = 16 > 5 \cdot 2 + 2 \ge |5z + 2|$, so that if g(z) = 5z + 2 so by Rouche's theorem $P - g = z^4$ and P have the same number of roots in B(0, 2).

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● の < @

$$(apply to P-g, g =) P-g, p)$$

Show that all the roots of $P(z) = z^4 + 5z + 2$ have modulus less than 2.

On the circle |z| = 2, we have $|z|^4 = 16 > 5 \cdot 2 + 2 \ge |5z + 2|$, so that if g(z) = 5z + 2 so by Rouche's theorem $P - g = z^4$ and P have the same number of roots in B(0,2). As 0 has multiplicity 4 for P - g, the four roots of P(z) all have modulus less than 2.

Show that all the roots of $P(z) = z^4 + 5z + 2$ have modulus less than 2.

On the circle |z| = 2, we have $|z|^4 = 16 > 5 \cdot 2 + 2 \ge |5z + 2|$, so that if g(z) = 5z + 2 so by Rouche's theorem $P - g = z^4$ and P have the same number of roots in B(0,2). As 0 has multiplicity 4 for P - g, the four roots of P(z) all have modulus less than 2.

We note further that if we take |z| = 1, then

 $|5z + 2| \ge 5 - 2 = 3 > |z^4| = 1$, hence P(z) and 5z + 2 have the same number of roots in B(0, 1). It follows P(z) has one root of modulus less than 1, and 3 of modulus between 1 and 2.

Remark

If $w_0 = f(z_0)$ then the multiplicity d of the zero of the function $g(z) = f(z) - w_0$ at z_0 is called the degree of f at z_0 . We showed that f(z) - w has as many zeros as $f(z) - w_0$ so f is locally d-to-1, counting multiplicities, that is, there are $r, \delta \in \mathbb{R}_{>0}$ such that for every $w \in B(w_0, \delta)$ the equation f(z) = w has d solutions counted with multiplicity in the disk $B(z_0, r)$.

Inverse function theorem

Theorem

(Inverse function theorem): Suppose that $f: U \to \mathbb{C}$ is injective and holomorphic and that $f'(z) \neq 0$ for all $z \in U$. If $g: f(U) \to U$ is the inverse of f, then g is holomorphic with g'(w) = 1/f'(g(w)).

Inverse function theorem

Theorem

(Inverse function theorem): Suppose that $f: U \to \mathbb{C}$ is injective and holomorphic and that $f'(z) \neq 0$ for all $z \in U$. If $g: f(U) \to U$ is the inverse of f, then g is holomorphic with g'(w) = 1/f'(g(w)).

Proof.

g is continuous: Let $V \subseteq f(U)$ open. Then then $g^{-1}(V) = f(V)$ is open by the open mapping theorem.

Inverse function theorem

Theorem

(Inverse function theorem): Suppose that $f: U \to \mathbb{C}$ is injective and holomorphic and that $f'(z) \neq 0$ for all $z \in U$. If $g: f(U) \to U$ is the inverse of f, then g is holomorphic with g'(w) = 1/f'(g(w)).

Proof.

g is continuous: Let $V \subseteq f(U)$ open. Then then $g^{-1}(V) = f(V)$ is open by the open mapping theorem.

g is holomorphic: fix $w_0 \in f(U)$ and let $z_0 = g(w_0)$. Note that since *g* and *f* are continuous, if $w \to w_0$ then $g(w) \to z_0$. Writing z = f(w) we have

$$\lim_{w \to w_0} \frac{g(w) - g(w_0)}{w - w_0} = \lim_{z \to z_0} \frac{z - z_0}{f(z) - f(z_0)} = 1/f'(z_0)$$

▲□▶▲□▶▲□▶▲□▶ □ のへで

Remark In fact the condition that $f'(z) \neq 0$ follows from the fact that f is bijective:

Remark

In fact the condition that $f'(z) \neq 0$ follows from the fact that f is bijective:

▲□▶▲□▶▲□▶▲□▶ □ のへで

if $f'(z_0) = 0$ and f is nonconstant, then $f(z) - f(z_0) = (z - z_0)^k g(z)$ where $g(z_0) \neq 0$ and $k \ge 1$

Remark

In fact the condition that $f'(z) \neq 0$ follows from the fact that f is bijective:

if $f'(z_0) = 0$ and f is nonconstant, then $f(z) - f(z_0) = (z - z_0)^k g(z)$ where $g(z_0) \neq 0$ and $k \ge 1$ But then z_0 is a root of multiplicity k of $f(z) - f(z_0) = 0$ so f(z)is locally k-to-1 near z_0 .

The Residue Theorem reduces the problem of calculating path integrals over closed paths to calculating the residues of power series.

The Residue Theorem reduces the problem of calculating path integrals over closed paths to calculating the residues of power series.

Recall that if a is an isolated singularity of f and

$$f(z) = \sum_{n \in \mathbb{Z}} c_n(z-a)^n, \quad \forall z \in B(a,r) \setminus \{a\}.$$

then the residue $\operatorname{Res}_{a}(f)$ of f at a is c_{-1} and

$$P_a(f) = \sum_{n=-1}^{-\infty} c_n(z-a)^n,$$

is the principal part of f at a. $P_a(f)$ is holomorphic on $\mathbb{C} \setminus \{a\}$

The Residue Theorem reduces the problem of calculating path integrals over closed paths to calculating the residues of power series.

Recall that if a is an isolated singularity of f and

$$f(z) = \sum_{n \in \mathbb{Z}} c_n(z-a)^n, \quad \forall z \in B(a,r) \setminus \{a\}.$$

then the residue $\operatorname{Res}_{a}(f)$ of f at a is c_{-1} and

$$P_a(f) = \sum_{n=-1}^{-\infty} c_n(z-a)^n,$$

is the principal part of *f* at *a*. $P_a(f)$ is holomorphic on $\mathbb{C} \setminus \{a\}$

It turns out that it is possible to use this method and calculate ordinary integrals of real functions. There are several tricks that allow us to pass from an integral of a real function to a path integral of a complex function.

Theorem

(Residue theorem): Suppose that U is an open set in \mathbb{C} and γ is a closed path whose inside is contained in U, so that for all $z \notin U$ we have $I(\gamma, z) = 0$. Then if $S \subset U$ is a finite set such that $S \cap \gamma^* = \emptyset$ and f is a holomorphic function on $U \setminus S$ we have

$$\frac{1}{2\pi i} \int_{\gamma} f(z) dz = \sum_{a \in S} I(\gamma, a) \operatorname{Res}_{a}(f)$$

For each $a \in S$ let $P_a(f)(z) = \sum_{n=-1}^{-\infty} c_n(a)(z-a)^n$ be the principal part of f at a, a holomorphic function on $\mathbb{C} \setminus \{a\}$.

For each $a \in S$ let $P_a(f)(z) = \sum_{n=-1}^{-\infty} c_n(a)(z-a)^n$ be the principal part of f at a, a holomorphic function on $\mathbb{C} \setminus \{a\}$.

< □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ > ○ < ○

Then $f - P_a(f)$ is holomorphic at $a \in S$, and thus $g(z) = f(z) - \sum_{a \in S} P_a(f)$ is holomorphic on all of U.

For each $a \in S$ let $P_a(f)(z) = \sum_{n=-1}^{-\infty} c_n(a)(z-a)^n$ be the principal part of f at a, a holomorphic function on $\mathbb{C} \setminus \{a\}$. Then $f - P_a(f)$ is holomorphic at $a \in S$, and thus $g(z) = f(z) - \sum_{a \in S} P_a(f)$ is holomorphic on all of U. So by Cauchy's Theorem $\int_{\gamma} g(z) dz = 0$, hence

$$\int_{\gamma} f(z) dz = \sum_{a \in S} \int_{\gamma} P_a(f)(z) dz$$

For each $a \in S$ let $P_a(f)(z) = \sum_{n=-1}^{-\infty} c_n(a)(z-a)^n$ be the principal part of f at a, a holomorphic function on $\mathbb{C} \setminus \{a\}$. Then $f - P_a(f)$ is holomorphic at $a \in S$, and thus $g(z) = f(z) - \sum_{a \in S} P_a(f)$ is holomorphic on all of U. So by Cauchy's Theorem $\int_{\gamma} g(z) dz = 0$, hence

$$\int_{\gamma} f(z) dz = \sum_{a \in S} \int_{\gamma} P_a(f)(z) dz$$

But the series $P_a(f)$ converges uniformly on γ^* so that

$$\int_{\gamma} P_a(f) dz = \int_{\gamma} \sum_{n=-1}^{-\infty} c_n(a) (z-a)^n = \sum_{n=1}^{\infty} \int_{\gamma} \frac{c_{-n}(a) dz}{(z-a)^n}$$
$$= \int_{\gamma} \frac{c_{-1}(a) dz}{z-a} = 2\pi i \cdot I(\gamma, a) \operatorname{Res}_a(f),$$

since for n > 1 the function $(z - a)^{-n}$ has a primitive on $\mathbb{C} \setminus \{a\}$.

Remark

In applications the winding numbers $I(\gamma, a)$ will be simple to compute in terms of the argument of (z - a) - in fact most often they will be 0 or ± 1 as we will usually apply the theorem to integrals around some standard contours that are simple closed curves.

< □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ > ○ < ○

Example Calculate the integral $\int_0^{2\pi} \frac{dt}{1+3\cos^2(t)}$.

$$\cos(t) = \Re(z) = \frac{1}{2}(z + \overline{z}) = \frac{1}{2}(z + 1/z)$$
, so

$$\cos(t) = \Re(z) = \frac{1}{2}(z + \overline{z}) = \frac{1}{2}(z + 1/z), \text{ so}$$
$$\frac{1}{1 + 3\cos^2(t)} = \frac{1}{1 + 3/4(z + 1/z)^2}$$
$$= \frac{1}{1 + \frac{3}{4}z^2 + \frac{3}{2} + \frac{3}{4}z^{-2}} = \frac{4z^2}{3 + 10z^2 + 3z^4},$$

$$\cos(t) = \Re(z) = \frac{1}{2}(z + \overline{z}) = \frac{1}{2}(z + 1/z), \text{ so}$$
$$\frac{1}{1 + 3\cos^2(t)} = \frac{1}{1 + 3/4(z + 1/z)^2}$$
$$= \frac{1}{1 + \frac{3}{4}z^2 + \frac{3}{2} + \frac{3}{4}z^{-2}} = \frac{4z^2}{3 + 10z^2 + 3z^4},$$

Let γ be the path $t \mapsto e^{it}$. Note then that

$$\int_{\gamma} f(z) dz = \int_{0}^{2\pi} f(e^{it}) i e^{it} dt$$
 so

◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶

$$\cos(t) = \Re(z) = \frac{1}{2}(z + \overline{z}) = \frac{1}{2}(z + 1/z), \text{ so}$$
$$\frac{1}{1 + 3\cos^2(t)} = \frac{1}{1 + 3/4(z + 1/z)^2}$$
$$= \frac{1}{1 + \frac{3}{4}z^2 + \frac{3}{2} + \frac{3}{4}z^{-2}} = \frac{4z^2}{3 + 10z^2 + 3z^4},$$

Let γ be the path $t \mapsto e^{it}$. Note then that

$$\int_{\gamma} f(z) dz = \int_{0}^{2\pi} f(e^{it}) i e^{it} dt$$
 so

$$\int_{0}^{2\pi} \frac{dt}{1+3\cos^{2}(t)} = \int_{\gamma} \frac{-4iz}{3+10z^{2}+3z^{4}} dz.$$

Thus we have turned our real integral into a contour integral, and to evaluate the contour integral we just need to calculate the residues of the meromorphic function $g(z) = \frac{-4iz}{3+10z^2+3z^4}$ at the poles it has inside the unit circle.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ のQ@

Thus we have turned our real integral into a contour integral, and to evaluate the contour integral we just need to calculate the residues of the meromorphic function $g(z) = \frac{-4iz}{3+10z^2+3z^4}$ at the poles it has inside the unit circle.

The poles of g(z) are the zeros of $p(z) = 3 + 10z^2 + 3z^4$, which are at $z^2 \in \{-3, -1/3\}$. Thus the poles inside the unit circle are at $\pm i/\sqrt{3}$.

▲□▶▲□▶▲□▶▲□▶ ▲□▶ ● のへで

Thus we have turned our real integral into a contour integral, and to evaluate the contour integral we just need to calculate the residues of the meromorphic function $g(z) = \frac{-4iz}{3+10z^2+3z^4}$ at the poles it has inside the unit circle.

The poles of g(z) are the zeros of $p(z) = 3 + 10z^2 + 3z^4$, which are at $z^2 \in \{-3, -1/3\}$. Thus the poles inside the unit circle are at $\pm i/\sqrt{3}$.

Since p has degree 4 and has four roots, they must all be simple zeros, and so g has simple poles at these points.

Applications of The Residue Theorem

Theorem

(Residue theorem): Suppose that U is an open set in \mathbb{C} and γ is a path whose inside is contained in U, so that for all $z \notin U$ we have $I(\gamma, z) = 0$. Then if $S \subset U$ is a finite set such that $S \cap \gamma^* = \emptyset$ and f is a holomorphic function on $U \setminus S$ we have

$$\frac{1}{2\pi i} \int_{\gamma} f(z) dz = \sum_{a \in S} I(\gamma, a) \operatorname{Res}_{a}(f)$$

Remark

Often we are interested in integrating along a path which is not closed or even finite, for example, we might wish to understand the integral of a function on the positive real axis.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへで

Remark

Often we are interested in integrating along a path which is not closed or even finite, for example, we might wish to understand the integral of a function on the positive real axis.

The residue theorem can still be a powerful tool in calculating these integrals, provided we complete the path to a closed one in such a way that we can control the extra contribution to the integral along the part of the path we add.

If we have a function *f* which we wish to integrate over the whole real line (so we have to treat it as an improper Riemann integral) then we may consider the contours Γ_R given as the concatenation of the paths $\gamma_1 : [-R, R] \to \mathbb{C}$ and $\gamma_2 : [0, 1] \to \mathbb{C}$ where

$$\gamma_1(t) = -\mathbf{R} + t; \quad \gamma_2(t) = \mathbf{R} e^{i\pi t}.$$

(so that $\Gamma_R = \gamma_2 \star \gamma_1$ traces out the boundary of a half-disk).

If we have a function *f* which we wish to integrate over the whole real line (so we have to treat it as an improper Riemann integral) then we may consider the contours Γ_R given as the concatenation of the paths $\gamma_1 : [-R, R] \to \mathbb{C}$ and $\gamma_2 : [0, 1] \to \mathbb{C}$ where

$$\gamma_1(t)=-oldsymbol{R}+t;\quad \gamma_2(t)=oldsymbol{R}oldsymbol{e}^{i\pi t}.$$

(so that $\Gamma_R = \gamma_2 \star \gamma_1$ traces out the boundary of a half-disk).

In many cases one can show that $\int_{\gamma_2} f(z) dz$ tends to 0 as $R \to \infty$, and by calculating the residues inside the contours Γ_R deduce the integral of f on $(-\infty, \infty)$.

$$\begin{array}{c}
 & f \rightarrow 0 \\
 & g_{1} \\
 & & & & \\
\end{array}$$

Example. Calculate the integral

$$\int_0^\infty \frac{dx}{1+x^2+x^4}.$$

(ロ) (型) (E) (E) (E) (O)
Example. Calculate the integral

$$\int_0^\infty \frac{dx}{1+x^2+x^4}.$$

This integral exists as an improper Riemann integral, and since the integrand is even, it is equal to

$$\frac{1}{2}\lim_{R\to\infty}\int_{-R}^{R}\frac{dx}{1+x^2+x^4}dx.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Example. Calculate the integral

$$\int_0^\infty \frac{dx}{1+x^2+x^4}.$$

This integral exists as an improper Riemann integral, and since the integrand is even, it is equal to

$$\frac{1}{2}\lim_{R\to\infty}\int_{-R}^{R}\frac{dx}{1+x^2+x^4}dx.$$

If $f(z) = 1/(1 + z^2 + z^4)$, then $\int_{\Gamma_R} f(z) dz$ is equal to $2\pi i$ times the sum of the residues inside the path Γ_R .

▲□▶▲□▶▲□▶▲□▶ □ のへで

Example. Calculate the integral

$$\int_0^\infty \frac{dx}{1+x^2+x^4}.$$

This integral exists as an improper Riemann integral, and since the integrand is even, it is equal to

$$\frac{1}{2}\lim_{R\to\infty}\int_{-R}^{R}\frac{dx}{1+x^2+x^4}dx.$$

If $f(z) = 1/(1 + z^2 + z^4)$, then $\int_{\Gamma_R} f(z) dz$ is equal to $2\pi i$ times the sum of the residues inside the path Γ_R . The function $f(z) = 1/(1 + z^2 + z^4)$ has poles at $z^2 = \pm e^{2\pi i/3}$ and hence at $\{e^{\pi i/3}, e^{2\pi i/3}, e^{4\pi i/3}, e^{5\pi i/3}\}$. They are all simple poles and of these only $\{\omega, \omega^2\}$ are in the upper-half plane, where $\omega = e^{i\pi/3}$. Thus by the residue theorem, for all R > 1 we have

$$\int_{\Gamma_R} f(z) dz = 2\pi i \big(\operatorname{Res}_{\omega}(f(z)) + \operatorname{Res}_{\omega^2}(f(z)) \big),$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○ のへぐ

Thus by the residue theorem, for all R > 1 we have

$$\int_{\Gamma_R} f(z) dz = 2\pi i \big(\operatorname{Res}_{\omega}(f(z)) + \operatorname{Res}_{\omega^2}(f(z)) \big),$$

We calculate the residues:

$$\operatorname{Res}_{\omega}(f(z)) = \lim_{z \to \omega} \frac{(z - \omega)}{1 + z^2 + z^4} = \frac{1}{2\omega + 4\omega^3} = \frac{1}{2\omega - 4}$$
$$\operatorname{Res}_{\omega^2}(f(z)) = \frac{1}{2\omega^2 + 4\omega^6} = \frac{1}{4 + 2\omega^2}$$

$$P(z) = (z - \omega) q(z) => P'(z) = q(z) + (z - \omega) q'(z) =)$$

=> $q(\omega) = P'(\omega)$
 $P'(z) = 2z + 4z^{3}$

【 ▲□▶▲□▶▲≣▶▲≣▶ ≣ りへで

w3=1

Thus by the residue theorem, for all R > 1 we have

$$\int_{\Gamma_R} f(z) dz = 2\pi i \big(\operatorname{Res}_{\omega}(f(z)) + \operatorname{Res}_{\omega^2}(f(z)) \big),$$

We calculate the residues:

$$\begin{aligned} \mathsf{Res}_{\omega}(f(z)) &= \lim_{z \to \omega} \frac{(z - \omega)}{1 + z^2 + z^4} = \frac{1}{2\omega + 4\omega^3} = \frac{1}{2\omega - 4} \\ \mathsf{Res}_{\omega^2}(f(z)) &= \frac{1}{2\omega^2 + 4\omega^6} = \frac{1}{4 + 2\omega^2} \\ \int_{\Gamma_R} f(z) dz &= 2\pi i \left(\frac{1}{2\omega - 4} + \frac{1}{2\omega^2 + 4}\right) = \pi i \left(\frac{1}{\omega - 2} + \frac{1}{\omega^2 + 2}\right) \\ &= \pi i \left(\frac{\omega^2 + \omega}{2(\omega - \omega^2) - 5}\right) = -\sqrt{3}\pi/(-3) = \pi/\sqrt{3}, \end{aligned}$$

(where we used the fact that $\omega^2 + \omega = i\sqrt{3}$ and $\omega - \omega^2 = 1$).

$$\int_{\Gamma_R} f(z)dz = \int_{-R}^R \frac{dt}{1+t^2+t^4} + \int_{\gamma_2} f(z)dz,$$

▲□▶▲□▶▲≡▶▲≡▶ ≡ のへで

Jordan's Lemma and applications

Recall:

Lemma

Let $g : \mathbb{R} \to \mathbb{R}$ be a twice differentiable function. Then if [a, b] is an interval on which g''(x) < 0, the function g is concave on [a, b], that is, for $x < y \in [a, b]$ we have

 $g(tx + (1 - t)y) \ge tg(x) + (1 - t)g(y), \quad t \in [0, 1].$

Given $x, y \in [a, b]$ and $t \in [0, 1]$ let $\xi = tx + (1 - t)y$, a point in the interval between x and y.

Given $x, y \in [a, b]$ and $t \in [0, 1]$ let $\xi = tx + (1 - t)y$, a point in the interval between x and y.

The slope of the chord between (x, g(x)) and $(\xi, g(\xi))$ is, by the Mean Value Theorem, equal to $g'(s_1)$ where s_1 lies between x and ξ , while the slope of the chord between $(\xi, g(\xi))$ and (y, g(y)) is equal to $g'(s_2)$ for s_2 between ξ and y.

Given $x, y \in [a, b]$ and $t \in [0, 1]$ let $\xi = tx + (1 - t)y$, a point in the interval between x and y.

The slope of the chord between (x, g(x)) and $(\xi, g(\xi))$ is, by the Mean Value Theorem, equal to $g'(s_1)$ where s_1 lies between x and ξ , while the slope of the chord between $(\xi, g(\xi))$ and (y, g(y)) is equal to $g'(s_2)$ for s_2 between ξ and y.

If $\underline{g(\xi)} < t\underline{g(x)} + (1-t)\underline{g(y)}$ it follows that $\underline{g'(s_1)} < \frac{\underline{g(y)} - \underline{g(x)}}{y-x}$ and $\underline{g'(s_2)} > \frac{\underline{g(y)} - \underline{g(x)}}{y-x}$.

$$g'(s_{1}) = \frac{g(f) - g(x)}{f - x} < \frac{t g(x) + (i - t) g(y) - g(x)}{t + x + (i - t) y - x} = \frac{(i - t) (g(y) - g(x))}{(i - t) (y - x)}$$

Given $x, y \in [a, b]$ and $t \in [0, 1]$ let $\xi = tx + (1 - t)y$, a point in the interval between x and y.

The slope of the chord between (x, g(x)) and $(\xi, g(\xi))$ is, by the Mean Value Theorem, equal to $g'(s_1)$ where s_1 lies between x and ξ , while the slope of the chord between $(\xi, g(\xi))$ and (y, g(y)) is equal to $g'(s_2)$ for s_2 between ξ and y.

If $g(\xi) < tg(x) + (1 - t)g(y)$ it follows that $g'(s_1) < \frac{g(y) - g(x)}{y - x}$ and $g'(s_2) > \frac{g(y) - g(x)}{y - x}$.

Thus by the mean value theorem for g'(x) applied to the points s_1 and s_2 it follows there is an $s \in (s_1, s_2)$ with $g''(s) = (g'(s_2) - g'(s_1))/(s_2 - s_1) > 0$, contradicting the assumption that g''(x) is negative on (a, b).

Corollary $\frac{\sin(t) \ge \frac{2}{\pi}t}{t} \text{ for } t \in [0, \pi/2] \text{ and } \sin(\pi - t) \ge 2(\pi - t)/\pi \text{ for } t \in [\pi/2, \pi].$

Corollary

$$\frac{\sin(t) \ge \frac{2}{\pi}t}{\pi} \text{ for } t \in [0, \pi/2] \text{ and } \sin(\pi - t) \ge 2(\pi - t)/\pi \text{ for } t \in [\pi/2, \pi].$$

By the lemma since $\sin'' t < 0$ in $(0, \pi/2)$

$$\sin t = \sin \left(\left(1 - \frac{2}{\pi} t \right) \cdot 0 + \frac{2}{\pi} t \cdot \frac{\pi}{2} \right) \ge \left(1 - \frac{2}{\pi} t \right) \sin 0 + \frac{2}{\pi} t \sin \frac{\pi}{2} = \frac{2}{\pi} t.$$

Clearly for $t \in [\pi/2, \pi]$, $\pi - t \in [0, \pi/2]$ so the same inequality applies.

But π/α is constant, so $\int_{\gamma_R} f(z) e^{i\alpha z} dz \to 0$ as $R \to \infty$ ▲□▶▲□▶▲□▶▲□▶ □ のへで

Remark

If η_R is an arc of a semicircle in the upper half plane, say $\eta_R(t) = Re^{it}$ for $0 \le t \le 2\pi/3$, then the same proof shows that

$$\int_{\eta_R} f(z) e^{i\alpha z} dz
ightarrow 0$$
 as $R
ightarrow \infty$.

This is sometimes useful when integrating around the boundary of a sector of disk.

Remark

If η_R is an arc of a semicircle in the upper half plane, say $\eta_R(t) = Re^{it}$ for $0 \le t \le 2\pi/3$, then the same proof shows that

$$\int_{\eta_R} f(z) e^{i\alpha z} dz \to 0 \quad \text{as} \quad R \to \infty.$$

This is sometimes useful when integrating around the boundary of a sector of disk.

Note that if $\alpha < 0$ then the integral of $f(z)e^{i\alpha z}$ around a semicircle in the lower half plane tends to zero as $R \to \infty$ provided $|f(z)| \to 0$ as $|z| \to \infty$ in the lower half plane. This follows immediately from the above applied to f(-z).

•

This is an improper integral of an even function, thus it exists if and only if the limit of $\int_{-R}^{R} \frac{\sin(x)}{x} dx$ exists as $R \to \infty$.

This is an improper integral of an even function, thus it exists if and only if the limit of $\int_{-R}^{R} \frac{\sin(x)}{x} dx$ exists as $R \to \infty$.

To compute this consider the integral along the closed curve η_R given by the concatenation $\eta_R = \nu_R \star \gamma_R$, where $\nu_R \colon [-R, R] \to \mathbb{R}$ given by $\nu_R(t) = t$ and $\gamma_R(t) = Re^{it}$ (where $t \in [0, \pi]$).

We will integrate over this $f(z) = \frac{e^{iz}-1}{z}$.

Note that the singularity at z = 0 is removable as

$$e^{iz} = 1 + iz + (iz)^2/2 + \dots$$
 so $\lim_{z \to 0} f(z) = i$.

▲□▶▲□▶▲□▶▲□▶ □ ∽��?

This is an improper integral of an even function, thus it exists if and only if the limit of $\int_{-R}^{R} \frac{\sin(x)}{x} dx$ exists as $R \to \infty$.

To compute this consider the integral along the closed curve η_R given by the concatenation $\eta_R = \nu_R \star \gamma_R$, where $\nu_R \colon [-R, R] \to \mathbb{R}$ given by $\nu_R(t) = t$ and $\gamma_R(t) = Re^{it}$ (where $t \in [0, \pi]$).

We will integrate over this $f(z) = \frac{e^{iz}-1}{z}$.

Note that the singularity at z = 0 is removable as

$$e^{iz} = 1 + iz + (iz)^2/2 + \dots$$
 so $\lim_{z \to 0} f(z) = i$.

Thus we have $\int_{\eta_R} f(z) dz = 0$ for all R > 0.

$$0 = \int_{\eta_R} f(z) dz = \int_{-R}^{R} f(t) dt + \int_{\gamma_R} \frac{e^{iz}}{z} dz - \int_{\gamma_R} \frac{dz}{z}.$$

◆□▶ ◆□▶ ◆目▶ ◆目▶ ▲□▶ ◆□▶

$$0 = \int_{\eta_R} f(z) dz = \int_{-R}^{R} f(t) dt + \underbrace{\int_{\gamma_R} \frac{e^{iz}}{z} dz}_{\gamma_R} - \int_{\gamma_R} \frac{dz}{z}.$$

Jordan's lemma ensures that the second term on the right tends to zero as $R \to \infty$ and

$$\int_{\gamma_R} \frac{dz}{z} = \int_0^{\pi} \frac{iRe^{it}}{Re^{it}} dt = i\pi$$

◆□▶ ◆□▶ ◆ 三▶ ◆ 三▶ ○ 三 ○ ○ ○ ○

$$0 = \int_{\eta_R} f(z) dz = \int_{-R}^{R} f(t) dt + \int_{\gamma_R} \frac{e^{iz}}{z} dz - \int_{\gamma_R} \frac{dz}{z}.$$

Jordan's lemma ensures that the second term on the right tends to zero as $R \to \infty$ and

$$\int_{\gamma_R} rac{dz}{z} = \int_0^\pi rac{i R e^{it}}{R e^{it}} dt = i \pi$$

It follows that $\int_{-R}^{R} f(t) dt$ tends to $i\pi$ as $R \to \infty$.

$$0 = \int_{\eta_R} f(z) dz = \int_{-R}^{R} f(t) dt + \int_{\gamma_R} \frac{e^{iz}}{z} dz - \int_{\gamma_R} \frac{dz}{z}.$$

Jordan's lemma ensures that the second term on the right tends to zero as $R \to \infty$ and

$$\int_{\gamma_R} rac{dz}{z} = \int_0^\pi rac{iRe^{it}}{Re^{it}} dt = i\pi$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへで

It follows that $\int_{-R}^{R} f(t) dt$ tends to $i\pi$ as $R \to \infty$.

$$f(t) = rac{\cos t + i \sin t}{t}$$
 so $\int_{-\infty}^{\infty} rac{\sin(x)}{x} dx = \pi.$
To deal with the previous integral it would be more natural to consider the function $\frac{e^{iz}}{z}$ instead.

To deal with the previous integral it would be more natural to consider the function $\frac{e^{iz}}{z}$ instead.

The problem is that this function has a pole at 0 so our contour can not include 0. The solution is to modify the contour slightly and go around 0.

To deal with the previous integral it would be more natural to consider the function $\frac{e^{iz}}{z}$ instead.

The problem is that this function has a pole at 0 so our contour can not include 0. The solution is to modify the contour slightly and go around 0.

Explicitly, we replace the ν_R with $\nu_R^- \star \gamma_{\epsilon} \star \nu_R^+$ where $\nu_R^{\pm}(t) = t$ and $t \in [-R, -\epsilon]$ for ν_R^- , and $t \in [\epsilon, R]$ for ν_R^+ (and as above $\gamma_{\epsilon}(t) = \epsilon e^{i(\pi - t)}$ for $t \in [0, \pi]$).

To deal with the previous integral it would be more natural to consider the function $\frac{e^{iz}}{z}$ instead.

The problem is that this function has a pole at 0 so our contour can not include 0. The solution is to modify the contour slightly and go around 0.

Explicitly, we replace the ν_R with $\nu_R^- \star \gamma_{\epsilon} \star \nu_R^+$ where $\nu_R^{\pm}(t) = t$ and $t \in [-R, -\epsilon]$ for ν_R^- , and $t \in [\epsilon, R]$ for ν_R^+ (and as above $\gamma_{\epsilon}(t) = \epsilon e^{i(\pi - t)}$ for $t \in [0, \pi]$).

How can we calculate the value of the integral after this change? We have a general lemma:

Lemma

Let $f: U \to \mathbb{C}$ be a meromorphic function with a simple pole at $a \in U$ and let $\gamma_{\epsilon}: [\alpha, \beta] \to \mathbb{C}$ be the path $\gamma_{\epsilon}(t) = a + \epsilon e^{it}$, then

$$\lim_{\epsilon \to 0} \int_{\gamma_{\epsilon}} f(z) dz = \operatorname{Res}_{a}(f) \cdot (\beta - \alpha) i.$$

Lemma

Let $f: U \to \mathbb{C}$ be a meromorphic function with a simple pole at $a \in U$ and let $\gamma_{\epsilon}: [\alpha, \beta] \to \mathbb{C}$ be the path $\gamma_{\epsilon}(t) = a + \epsilon e^{it}$, then

$$\lim_{\epsilon \to 0} \int_{\gamma_{\epsilon}} f(z) dz = \operatorname{Res}_{a}(f) \cdot (\beta - \alpha) i.$$

Proof.

Since *f* has a simple pole at *a*, we may write

$$f(z)=\frac{c}{z-a}+g(z)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ の�?

where g(z) is holomorphic near z and $c = \operatorname{Res}_{a}(f)$.

As *g* is holomorphic at *a*, it is continuous at *a*, and so bounded. Let M, r > 0 be such that |g(z)| < M for all $z \in B(a, r)$. Then if $0 < \epsilon < r$ we have

$$\left|\int_{\gamma_{\epsilon}} g(z) dz\right| \leq \ell(\gamma_{\epsilon}) M = (\beta - \alpha) \epsilon \cdot M \to 0$$

as $\epsilon \rightarrow 0$.

$$0 = \int_{\Gamma_{\epsilon}} f(z)dz = \int_{-R}^{-\epsilon} \frac{e^{ix}}{x}dx + \int_{\gamma_{\epsilon}} \frac{e^{iz}}{z}dz + \int_{\epsilon}^{R} \frac{e^{ix}}{x}dx + \int_{\gamma_{R}} \frac{e^{iz}}{z}dz.$$
$$= 2i\int_{\epsilon}^{R} \frac{\sin(x)}{x} + \int_{\gamma_{\epsilon}} \frac{e^{iz}}{z} + \int_{\gamma_{R}} \frac{e^{iz}}{z}dz$$
$$\to 2i\int_{0}^{R} \frac{\sin(x)}{x}dx - i\pi + \int_{\gamma_{R}} \frac{e^{iz}}{z}dz.$$

as $\epsilon \rightarrow 0$.

Then letting $R \to \infty$, it follows from Jordan's Lemma that the third term tends to zero so we see that

$$\int_{-\infty}^{\infty} \frac{\sin(x)}{x} dx = 2 \int_{0}^{\infty} \frac{\sin(x)}{x} dx = \pi$$

•

Recall if f has a pole of order k at z_0 then

$$f(z)=\sum_{n\geq -k}c_n(z-z_0)^n.$$

is the residue of f at z_0 .

How do we calculate these?

In order to use the Residue Theorem we need to calculate residues of meromorphic functions. The integral formulas we have obtained for the residue are often not the best way to do this.

In order to use the Residue Theorem we need to calculate residues of meromorphic functions. The integral formulas we have obtained for the residue are often not the best way to do this.

We discuss now a more direct method to calculate the residue in the case of functions which are given as the ratio of two holomorphic functions.

We discuss now a more direct method to calculate the residue in the case of functions which are given as the ratio of two holomorphic functions.

Precisely let $F: U \to \mathbb{C}$ given to us as a ratio f/g of two holomorphic functions f, g on U. The singularities of the function F are therefore poles which are located precisely at the (isolated) zeros of the function g.

where $c_k \neq 0$ and the power series converges on $B(0, r) \subseteq U$ for some r > 0.

We set $h(z) = \sum_{n=1}^{\infty} a_n z^{n-1}$, then

$$\frac{1}{g(z)}=\frac{1}{c_kz^k}\big(1+zh(z)\big)^{-1},$$

we expand

$$\frac{1}{1+zh(z)}=\sum_{n=0}^{\infty}(-1)^nz^nh(z)^n$$

◆□▶ ◆□▶ ◆ 三▶ ◆ 三▶ ○ 三 ○ ○ ○ ○

Specifically if $M = \max\{h(z) : z \in \overline{B}(0, r)\}$ we may take $\delta = \min(r, 1/2M)$.

Specifically if $M = \max\{h(z) : z \in \overline{B}(0, r)\}$ we may take $\delta = \min(r, 1/2M)$.

We can 'ignore' the terms after k as:

$$\sum_{m\geq k} (-1)^m z^m h(z)^m = z^k h_1(z)$$

(where h_1 is holomorphic) since then $\frac{1}{c_k z^k} \sum_{n \ge k} (-1)^n z^n h(z)^n$ is holmorphic.

< ロ > < 団 > < 豆 > < 豆 > < 豆 > < 豆 < つ < ○</p>

Specifically if $M = \max\{h(z) : z \in \overline{B}(0, r)\}$ we may take $\delta = \min(r, 1/2M)$.

We can 'ignore' the terms after k as:

$$\sum_{m\geq k} (-1)^m z^m h(z)^m = z^k h_1(z)$$

(where h_1 is holomorphic) since then $\frac{1}{c_k z^k} \sum_{n \ge k} (-1)^n z^n h(z)^n$ is holmorphic.

Hence the principal part of the Laurent series of 1/g(z) is equal to the principal part of the function

$$\frac{1}{c_k z^k} \sum_{n=1}^k (-1)^{k-1} z^k h(z)^k$$

Since we know the power series for h(z), this allows us to compute the principal part of $\frac{1}{g(z)}$.

Since we know the power series for h(z), this allows us to compute the principal part of $\frac{1}{g(z)}$.

Finally, the principal part $P_0(F)$ of F = f/g at z = 0 is just the principal part of the function $f(z) \cdot P_0(g)$, which again we can compute if we know the power series expansion of f(z) at 0.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ の�?

Example. Calculate the principal part of $f(z) = 1/(z^2 \sinh(z)^3)$.

Example. Calculate the principal part of $f(z) = 1/(z^2 \sinh(z)^3)$.

 $\sinh(z) = (e^z - e^{-z})/2$ vanishes on $\pi i\mathbb{Z}$, and these zeros are all simple since $\frac{d}{dz}(\sinh(z)) = \cosh(z)$ has $\cosh(n\pi i) = (-1)^n \neq 0$.

1)
$$e^{X+iY} - e^{X-iY} = 0 = e^{X} - e^{X} = 0 = X = 0$$

and $e^{2iY} = 1 = Y \in \pi i \mathbb{Z}$

2)
$$f(z) = (z-a)^2 g(z) = f(a) = 0$$

.

▲□▶▲□▶▲≡▶▲≡▶ ▲□ ♥ ④ ●

Example. Calculate the principal part of $f(z) = 1/(z^2 \sinh(z)^3)$.

 $\sinh(z) = (e^z - e^{-z})/2$ vanishes on $\pi i\mathbb{Z}$, and these zeros are all simple since $\frac{d}{dz}(\sinh(z)) = \cosh(z)$ has $\cosh(n\pi i) = (-1)^n \neq 0$.

Thus f(z) has a pole or order 5 at zero, and poles of order 3 at π in for each $n \in \mathbb{Z} \setminus \{0\}$. We calculate the principal part of f at z = 0.
