

Questions marked as optional are not expected to be handed in and will not be marked.

1. Find a parametric solution for the PDE

$$u_x + uu_y = 1,$$

with  $u = x/2$  on  $y = x$ ,  $0 \leq x \leq 1$ , and state the domain of definition.

2. Find the solution of

$$yu_x - 2xyu_y = 2xu$$

such that  $u = y^3$  when  $x = 0$  and  $1 \leq y \leq 2$ . What is the domain of validity of the solution? Describe the behaviour of  $u$  as  $y \rightarrow 0+$  in this domain.

3. Find, in parametric form, the solution of

$$(x - u)u_x + u_y + u = 0$$

with  $u = 1$  on  $y = x$ ,  $0 < x < 1/2$ . Show that  $u$  is determined in the region

$$-\sinh y < x < \frac{e^{1/2-y}}{2}.$$

4. (a) Suppose the ODEs

$$\frac{dx}{a(x, y, u)} = \frac{dy}{b(x, y, u)} = \frac{du}{c(x, y, u)}$$

have two linearly independent solutions  $f(x, y, u) = \text{const}$  and  $g(x, y, u) = \text{const}$ . Explain why  $f$  and  $g$  must satisfy the equations

$$af_x + bf_y + cf_u = 0, \quad ag_x + bg_y + cg_u = 0.$$

- (b) [This part is optional, but its application to the example in (c).]

Show that, if  $u(x, y)$  is determined implicitly by the relation

$$f(x, y, u) = F(g(x, y, u)),$$

where  $F$  is any (suitably smooth) function, then  $u(x, y)$  satisfies the PDE

$$a \frac{\partial u}{\partial x} + b \frac{\partial u}{\partial y} = c.$$

[Hint: Differentiate with respect to  $x$  and  $y$  and then try to eliminate  $f_x$ ,  $f_y$ ,  $g_x$ ,  $g_y$ .]

- (c) Hence show that the general solution of the PDE  $yu_x + u^2u_y = u^2$  is given by

$$u = y + F\left(x + \frac{y}{u} - \log u\right).$$

5. Find the explicit solution of the PDE

$$(1 + u) \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = u$$

subject to the boundary data

$$(i) \quad u(x, 1) = x \text{ for } 0 \leq x \leq 1; \quad (ii) \quad u(x, 1) = -x \text{ for } 0 \leq x \leq 1.$$

In case (i), state where the solution is uniquely determined and sketch this region in the  $(x, y)$ -plane.

In case (ii), show that all the characteristic projections pass through the point  $(x, y) = (\log 2, 2)$ , where the Jacobian  $J = |\partial(x, y)/\partial(\tau, s)| = 0$ . Hence find and sketch the region of the  $(x, y)$ -plane where  $u$  is uniquely determined. Explain what happens to the graph of  $u(x, y)$  versus  $x$  as  $y$  increases from 1 to 2.

6. Solve the PDE

$$\frac{\partial u}{\partial t} + \frac{\partial}{\partial x} \left( \frac{u^2}{2} \right) = 0$$

for  $t > 0$ , subject to  $u(x, 0) = f(x)$ , in each of the following two cases:

$$(i) \quad f(x) = \begin{cases} 0 & x < 0, \\ x & 0 \leq x < 1, \\ 1 & 1 \leq x, \end{cases} \quad (ii) \quad f(x) = \begin{cases} 0 & x < 0, \\ -x & 0 \leq x < 1, \\ -1 & 1 \leq x. \end{cases}$$

In case (ii), find a single-valued weak solution by introducing a shock. Sketch the resulting solution  $u(x, t)$  versus  $x$  as  $t$  varies, and the characteristic projections in the  $(x, t)$ -plane.

7. Solve the Cauchy problem

$$\begin{aligned} \frac{\partial u}{\partial x} + u \frac{\partial u}{\partial y} &= 0 & x > 0, \\ u &= u_0(y) & x = 0, \end{aligned}$$

where

$$u_0(y) = \begin{cases} y(1-y) & 0 < y < 1, \\ 0 & y < 0, \ y > 1. \end{cases}$$

Show that  $u$  becomes multi-valued on the curve  $y = (1+x)^2/(4x)$ ,  $x > 1$ . Sketch the characteristic projections in the  $(x, y)$ -plane and indicate where a unique classical solution exists. Also sketch profiles of  $u(x, y)$  versus  $y$  for different values of  $x > 0$ .

8. Suppose  $u(x, t)$  satisfies

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} = \epsilon \frac{\partial^2 u}{\partial x^2}, \quad 0 < \epsilon \ll 1.$$

Show that the change of variables to  $\xi$  and  $\tau$ , where  $t = \tau$ ,  $x - V\tau = \epsilon\xi$ , gives

$$(-V + u) \frac{\partial u}{\partial \xi} = \frac{\partial^2 u}{\partial \xi^2} \quad (1)$$

when small terms of order  $\epsilon$  are neglected. Assuming that  $u \rightarrow u_{\pm}$  as  $\xi \rightarrow \pm\infty$  (where  $u_{\pm}$  are constants), deduce that

$$V = \frac{1}{2} (u_- + u_+), \quad u_+ \leq u_-,$$

Determine the form of and sketch the solution  $u(\xi)$ , and use this to interpret the nature and location of shocks in the system when  $\epsilon = 0$ .

*Hint: to show  $u_+ \leq u_-$ , first multiply (1) by  $u$  and integrate to obtain the relation*

$$\left[ -\frac{Vu^2}{2} + \frac{u^3}{3} \right]_{-\infty}^{+\infty} + \int_{-\infty}^{\infty} \left( \frac{\partial u}{\partial \xi} \right)^2 d\xi = 0.$$
