# Elliptic boundary-value problems

A second-order linear PDE for a function u = u(x, y):

$$a(x,y)\frac{\partial^2 u}{\partial x^2} + 2b(x,y)\frac{\partial^2 u}{\partial x \partial y} + c(x,y)\frac{\partial^2 u}{\partial y^2} + d(x,y)\frac{\partial u}{\partial x} + e(x,y)\frac{\partial u}{\partial y} = f(x,y)$$
is

- ELLIPTIC if  $b^2 ac < 0$ ;
- PARABOLIC if  $b^2 ac = 0$ ; (and at least one of a or c is nonzero);
- HYPERBOLIC if  $b^2 ac > 0$ .

# Elliptic boundary-value problems

A second-order linear PDE for a function u = u(x, y):

$$a(x,y)\frac{\partial^2 u}{\partial x^2} + 2b(x,y)\frac{\partial^2 u}{\partial x \partial y} + c(x,y)\frac{\partial^2 u}{\partial y^2} + d(x,y)\frac{\partial u}{\partial x} + e(x,y)\frac{\partial u}{\partial y} = f(x,y)$$
is

- ELLIPTIC if  $b^2 ac < 0$ ;
- PARABOLIC if  $b^2 ac = 0$ ; (and at least one of a or c is nonzero);
- HYPERBOLIC if  $b^2 ac > 0$ .

Ellipticity amounts to requiring that a and c are of the same sign, say a>0 and c>0 (or a<0 and c<0), and  $ac-b^2>0$ , which is equivalent (by Sylvester's criterion) to demanding that

$$A = \left(\begin{array}{cc} a & b \\ b & c \end{array}\right)$$

is a positive definite matrix, i.e.  $\xi^T A \xi > 0$  for all  $\xi \in \mathbb{R}^2 \setminus \{0\}$ .

(a) Laplace's equation:  $\Delta u = 0$ ;

- (a) Laplace's equation:  $\Delta u = 0$ ;
- (b) Poisson's equation  $-\Delta u = f$ ;

- (a) Laplace's equation:  $\Delta u = 0$ ;
- (b) Poisson's equation  $-\Delta u = f$ ;
- (c) More generally, let  $\Omega$  be a bounded open set in  $\mathbb{R}^n$ , and consider the (linear) second-order partial differential equation

$$-\sum_{i,j=1}^n \frac{\partial}{\partial x_j} \left( a_{i,j}(x) \frac{\partial u}{\partial x_i} \right) + \sum_{i=1}^n b_i(x) \frac{\partial u}{\partial x_i} + c(x) u = f(x), \quad x \in \Omega,$$

- (a) Laplace's equation:  $\Delta u = 0$ ;
- (b) Poisson's equation  $-\Delta u = f$ ;
- (c) More generally, let  $\Omega$  be a bounded open set in  $\mathbb{R}^n$ , and consider the (linear) second-order partial differential equation

$$-\sum_{i,j=1}^n \frac{\partial}{\partial x_j} \left( a_{i,j}(x) \frac{\partial u}{\partial x_i} \right) + \sum_{i=1}^n b_i(x) \frac{\partial u}{\partial x_i} + c(x) u = f(x), \quad x \in \Omega,$$

where the coefficients  $a_{i,j}$ ,  $b_i$ , c and f are such that

$$a_{i,j} \in C^1(\overline{\Omega}), \qquad i,j = 1, \dots, n;$$
  $b_i \in C(\overline{\Omega}), \qquad i = 1, \dots, n;$   $c \in C(\overline{\Omega}), \qquad f \in C(\overline{\Omega}), \quad \text{and}$ 

$$\sum_{i=1}^{n} a_{i,j}(x)\xi_{i}\xi_{j} \geq \tilde{c} \sum_{i=1}^{n} \xi_{i}^{2} \qquad \forall \xi = (\xi_{1}, \ldots, \xi_{n}) \in \mathbb{R}^{n}, \quad \forall x \in \overline{\Omega};$$

here  $\tilde{c}$  is a positive constant independent of x and  $\xi$ .

(a) u = g on  $\partial \Omega$  (Dirichlet boundary condition);

- (a) u = g on  $\partial \Omega$  (Dirichlet boundary condition);
- (b)  $\frac{\partial u}{\partial \nu} = g$  on  $\partial \Omega$ , where  $\nu$  denotes the unit outward normal vector to  $\partial \Omega$  (Neumann boundary condition);

- (a) u = g on  $\partial \Omega$  (Dirichlet boundary condition);
- (b)  $\frac{\partial u}{\partial \nu} = g$  on  $\partial \Omega$ , where  $\nu$  denotes the unit outward normal vector to  $\partial \Omega$  (Neumann boundary condition);
- (c)  $\frac{\partial u}{\partial \nu} + \sigma u = g$  on  $\partial \Omega$ , where  $\sigma(x) \geq 0$  on  $\partial \Omega$  (Robin boundary cond.);

- (a) u = g on  $\partial \Omega$  (Dirichlet boundary condition);
- (b)  $\frac{\partial u}{\partial \nu} = g$  on  $\partial \Omega$ , where  $\nu$  denotes the unit outward normal vector to  $\partial \Omega$  (Neumann boundary condition);
- (c)  $\frac{\partial u}{\partial \nu} + \sigma u = g$  on  $\partial \Omega$ , where  $\sigma(x) \geq 0$  on  $\partial \Omega$  (Robin boundary cond.);
- (d) A more general version of (b) and (c) is

$$\sum_{i,j=1}^{n} a_{i,j} \frac{\partial u}{\partial x_i} \cos \alpha_j + \sigma(x) u = g \quad \text{on } \partial \Omega,$$

where  $\alpha_j$  is the angle between the unit outward normal vector  $\nu$  to  $\partial\Omega$  and the  $Ox_i$  axis (oblique derivative boundary cond.).

#### Classical solutions

Consider the homogeneous Dirichlet boundary-value problem:

$$-\sum_{i,j=1}^{n} \frac{\partial}{\partial x_{j}} \left( a_{i,j}(x) \frac{\partial u}{\partial x_{i}} \right) + \sum_{i=1}^{n} b_{i}(x) \frac{\partial u}{\partial x_{i}} + c(x)u = f(x) \quad \text{for } x \in \Omega,$$
 (1)

$$u=0$$
 on  $\partial\Omega,$  (2)

where  $a_{i,j}$ ,  $b_i$ , c and f are as stated earlier.

#### Classical solutions

Consider the homogeneous Dirichlet boundary-value problem:

$$-\sum_{i,j=1}^{n} \frac{\partial}{\partial x_{j}} \left( a_{i,j}(x) \frac{\partial u}{\partial x_{i}} \right) + \sum_{i=1}^{n} b_{i}(x) \frac{\partial u}{\partial x_{i}} + c(x)u = f(x) \quad \text{for } x \in \Omega,$$
 (1)

$$u=0$$
 on  $\partial\Omega$ , (2)

where  $a_{i,j}$ ,  $b_i$ , c and f are as stated earlier.

A function  $u \in C^2(\Omega) \cap C(\overline{\Omega})$  satisfying (1) and (2) is called a *classical solution* of this problem.

#### Classical solutions

Consider the homogeneous Dirichlet boundary-value problem:

$$-\sum_{i,j=1}^{n} \frac{\partial}{\partial x_{j}} \left( a_{i,j}(x) \frac{\partial u}{\partial x_{i}} \right) + \sum_{i=1}^{n} b_{i}(x) \frac{\partial u}{\partial x_{i}} + c(x)u = f(x) \quad \text{for } x \in \Omega,$$
 (1)

$$u=0$$
 on  $\partial\Omega,$  (2)

where  $a_{i,j}$ ,  $b_i$ , c and f are as stated earlier.

A function  $u \in C^2(\Omega) \cap C(\overline{\Omega})$  satisfying (1) and (2) is called a *classical solution* of this problem.

The theory of partial differential equations tells us that (1), (2) has a unique classical solution, provided that  $a_{i,j}$ ,  $b_i$ , c, f and  $\partial\Omega$  are sufficiently smooth.

### Weak solutions

If these smoothness requirements on the coefficients are violated, the classical theory of partial differential equations is inappropriate.

#### Weak solutions

If these smoothness requirements on the coefficients are violated, the classical theory of partial differential equations is inappropriate.

### Example

Take, for example, Poisson's equation on the cube  $\Omega = (-1,1)^n$  in  $\mathbb{R}^n$ , subject to a zero Dirichlet boundary condition:

$$-\Delta u = \operatorname{sgn}\left(\frac{1}{2} - |x|\right), \quad x \in \Omega, 
 u = 0, \quad x \in \partial\Omega.$$
(\*)

#### Weak solutions

If these smoothness requirements on the coefficients are violated, the classical theory of partial differential equations is inappropriate.

### Example

Take, for example, Poisson's equation on the cube  $\Omega = (-1,1)^n$  in  $\mathbb{R}^n$ , subject to a zero Dirichlet boundary condition:

$$-\Delta u = \operatorname{sgn}\left(\frac{1}{2} - |x|\right), \quad x \in \Omega, 
 u = 0, \quad x \in \partial\Omega.$$
(\*)

This problem has no classical solution,  $u \in C^2(\Omega) \cap C(\overline{\Omega})$ , for otherwise  $\Delta u$  would be a continuous function on  $\Omega$ , which is not possible because  $\mathrm{sgn}(1/2-|x|)$  is not a continuous function on  $\Omega$ .

### Definition (Weak solution)

Let  $a_{i,j} \in C(\overline{\Omega})$ , i, j = 1, ..., n,  $b_i \in C(\overline{\Omega})$ , i = 1, ..., n,  $c \in C(\overline{\Omega})$ , and let  $f \in L^2(\Omega)$ . A function  $u \in H^1_0(\Omega)$  satisfying

$$\sum_{i,j=1}^{n} \int_{\Omega} a_{i,j}(x) \frac{\partial u}{\partial x_{i}} \frac{\partial v}{\partial x_{j}} dx + \sum_{i=1}^{n} \int_{\Omega} b_{i}(x) \frac{\partial u}{\partial x_{i}} v dx + \int_{\Omega} c(x) uv dx$$
$$= \int_{\Omega} f(x) v(x) dx \qquad \forall v \in H_{0}^{1}(\Omega)$$

is called a weak solution of (1), (2).

#### Example

Suppose that  $\Omega=(a,b)\times(c,d)\subset\mathbb{R}^2$  and let  $f\in L^2(\Omega)$ . We wish to state the weak formulation of the elliptic boundary-value problem

$$-\Delta u + u = f \quad \text{in } \Omega,$$
  
$$u = 0 \quad \text{on } \partial \Omega.$$

**Solution.** Note that  $-\Delta u = -\operatorname{div}(\nabla u)$  and

$$\int_{\Omega} (-\Delta u) \, v \, \mathrm{d}x = -\int_{\Omega} \operatorname{div}(\nabla u) \, v \, \mathrm{d}x = \int_{\Omega} \nabla u \cdot \nabla v \, \mathrm{d}x$$

for all  $v \in H_0^1(\Omega)$  by the divergence theorem.

#### Example

Suppose that  $\Omega=(a,b)\times(c,d)\subset\mathbb{R}^2$  and let  $f\in L^2(\Omega)$ . We wish to state the weak formulation of the elliptic boundary-value problem

$$-\Delta u + u = f \quad \text{in } \Omega,$$
  
$$u = 0 \quad \text{on } \partial \Omega.$$

**Solution.** Note that  $-\Delta u = -\operatorname{div}(\nabla u)$  and

$$\int_{\Omega} (-\Delta u) v \, dx = -\int_{\Omega} \operatorname{div}(\nabla u) v \, dx = \int_{\Omega} \nabla u \cdot \nabla v \, dx$$

for all  $v \in H_0^1(\Omega)$  by the divergence theorem.

Hence, the weak formulation of the boundary-value problem is: find  $u \in H^1_0(\Omega)$  such that

$$\int_{\Omega} \nabla u \cdot \nabla v + u \, v \, \mathrm{d}x = \int_{\Omega} f \, v \, \mathrm{d}x \qquad \forall v \in H_0^1(\Omega).$$

## Introduction to the theory of finite difference schemes

Let  $\Omega$  be a bounded open set in  $\mathbb{R}^n$  and suppose that we wish to solve the boundary-value problem

$$\mathcal{L}u = f$$
 in  $\Omega$ ,  
 $\mathcal{B}u = g$  on  $\Gamma := \partial \Omega$ , (3)

where  $\mathcal{L}$  is a linear partial differential operator, and  $\mathcal{B}$  is a linear operator which specifies the boundary condition.

## Introduction to the theory of finite difference schemes

Let  $\Omega$  be a bounded open set in  $\mathbb{R}^n$  and suppose that we wish to solve the boundary-value problem

$$\mathcal{L}u = f$$
 in  $\Omega$ ,  
 $\mathcal{B}u = g$  on  $\Gamma := \partial \Omega$ , (3)

where  $\mathcal L$  is a linear partial differential operator, and  $\mathcal B$  is a linear operator which specifies the boundary condition. For example,

$$\mathcal{L}u \equiv -\sum_{i,j=1}^{n} \frac{\partial}{\partial x_{j}} \left( a_{i,j}(x) \frac{\partial u}{\partial x_{i}} \right) + \sum_{i=1}^{n} b_{i} \frac{\partial u}{\partial x_{i}} + cu,$$

and

$$\mathcal{B}u \equiv u$$
 (Dirichlet boundary condition),

or

$$\mathcal{B}u \equiv \frac{\partial u}{\partial \nu}$$
 (Neumann boundary condition),

or some other boundary condition.

## The first step

Suppose that we have 'approximated'  $\overline{\Omega}=\Omega\cup\Gamma$  by a finite set of points

$$\overline{\Omega}_h = \Omega_h \cup \Gamma_h$$
,

where  $\Omega_h \subset \Omega$  and  $\Gamma_h \subset \Gamma$ .

# The first step

Suppose that we have 'approximated'  $\overline{\Omega}=\Omega\cup\Gamma$  by a finite set of points

$$\overline{\Omega}_h = \Omega_h \cup \Gamma_h$$
,

where  $\Omega_h \subset \Omega$  and  $\Gamma_h \subset \Gamma$ .

- $\overline{\Omega}_h$  is called a mesh;
- $\Omega_h$  is the set of interior mesh-points; and
- $\Gamma_h$  the set boundary mesh-points.

# The first step

Suppose that we have 'approximated'  $\overline{\Omega}=\Omega\cup\Gamma$  by a finite set of points

$$\overline{\Omega}_h = \Omega_h \cup \Gamma_h$$
,

where  $\Omega_h \subset \Omega$  and  $\Gamma_h \subset \Gamma$ .

- $\overline{\Omega}_h$  is called a mesh;
- $\Omega_h$  is the set of interior mesh-points; and
- $\Gamma_h$  the set boundary mesh-points.

The parameter  $h = (h_1, \ldots, h_n)$  measures the 'fineness' of the mesh (here  $h_i$  denotes the mesh-size in the coordinate direction  $Ox_i$ ): the smaller  $\max_{1 \le i \le n} h_i$  is, the finer the mesh.

## The second step

Having constructed the mesh, we replace the derivatives in  $\mathcal L$  by divided differences, and we approximate the boundary condition in a similar fashion. This yields the finite difference scheme

$$\mathcal{L}_h U(x) = f_h(x), \qquad x \in \Omega_h, \mathcal{B}_h U(x) = g_h(x), \qquad x \in \Gamma_h,$$
(4)

where  $f_h$  and  $g_h$  are suitable approximations of f and g.

Now (4) is a system of linear algebraic equations involving the values of  $\boldsymbol{U}$  at the mesh-points, and can be solved by Gaussian elimination or an iterative method, provided that it has a unique solution.

Now (4) is a system of linear algebraic equations involving the values of U at the mesh-points, and can be solved by Gaussian elimination or an iterative method, provided that it has a unique solution.

The sequence

$$\{U(x):x\in\overline{\Omega}_h\}$$

is an approximation to

$$\{u(x):x\in\overline{\Omega}_h\},\$$

the values of the exact solution at the mesh-points.

• the first, and most basic, is the problem of approximation, that is, whether (4) approximates the boundary-value problem (3) in some sense, and whether its solution  $\{U(x):x\in\overline{\Omega}_h\}$  approximates  $\{u(x):x\in\overline{\Omega}_h\}$ , the values of the exact solution at the mesh-points.

- the first, and most basic, is the problem of approximation, that is, whether (4) approximates the boundary-value problem (3) in some sense, and whether its solution  $\{U(x):x\in\overline{\Omega}_h\}$  approximates  $\{u(x):x\in\overline{\Omega}_h\}$ , the values of the exact solution at the mesh-points.
- the second concerns the effective solution of the discrete problem (4) using techniques from Numerical Linear Algebra.

- the first, and most basic, is the problem of approximation, that is, whether (4) approximates the boundary-value problem (3) in some sense, and whether its solution  $\{U(x):x\in\overline{\Omega}_h\}$  approximates  $\{u(x):x\in\overline{\Omega}_h\}$ , the values of the exact solution at the mesh-points.
- the second concerns the effective solution of the discrete problem (4) using techniques from Numerical Linear Algebra.

Here we shall be primarily concerned with the first of these two problems — the question of approximation — although we shall also briefly consider the question of iterative solution of systems of linear algebraic equations by a simple iterative method.
