Marc Lackenby

Trinity Term 2022

# Shortest paths

# Shortest Paths

Let  $G$  be a connected graph.

# Shortest Paths

Let  $G$  be a connected graph.

# Shortest Paths

Let  $G$  be a connected graph.

Let  $\ell(e) > 0$  for  $e \in E(G)$  be the 'length' of the edge  $e$ .

# Shortest Paths

Let  $G$  be a connected graph.

Let  $\ell(e) > 0$  for  $e \in E(G)$  be the 'length' of the edge  $e$ .

The  *$\ell$ -length* of a path  $P$  is

$$\ell(P) = \sum_{e \in E(P)} \ell(e).$$

# Shortest Paths

Let  $G$  be a connected graph.

Let  $\ell(e) > 0$  for  $e \in E(G)$  be the 'length' of the edge  $e$ .

The  *$\ell$ -length* of a path  $P$  is

$$\ell(P) = \sum_{e \in E(P)} \ell(e).$$

Given  $x$  and  $y$  in  $V(G)$ , an  *$\ell$ -shortest  $xy$ -path* is an  $xy$ -path  $P$  that minimises  $\ell(P)$ .

# Shortest Paths

Let  $G$  be a connected graph.

Let  $\ell(e) > 0$  for  $e \in E(G)$  be the 'length' of the edge  $e$ .

The  *$\ell$ -length* of a path  $P$  is

$$\ell(P) = \sum_{e \in E(P)} \ell(e).$$

Given  $x$  and  $y$  in  $V(G)$ , an  *$\ell$ -shortest  $xy$ -path* is an  $xy$ -path  $P$  that minimises  $\ell(P)$ .

# Dijkstra's Algorithm

For vertices  $x$  and  $y$ , this finds an  $\ell$ -shortest  $xy$ -path.

# Dijkstra's Algorithm

For vertices  $x$  and  $y$ , this finds an  $\ell$ -shortest  $xy$ -path.

The idea of the algorithm is to maintain a 'tentative distance from  $x$ ' called  $D(v)$  for each  $v \in V(G)$ .

# Dijkstra's Algorithm

For vertices  $x$  and  $y$ , this finds an  $\ell$ -shortest  $xy$ -path.

The idea of the algorithm is to maintain a 'tentative distance from  $x$ ' called  $D(v)$  for each  $v \in V(G)$ .

At each step of the algorithm we finalise  $D(u)$  for some vertex  $u$ .

# Dijkstra's Algorithm

For vertices  $x$  and  $y$ , this finds an  $\ell$ -shortest  $xy$ -path.

The idea of the algorithm is to maintain a 'tentative distance from  $x$ ' called  $D(v)$  for each  $v \in V(G)$ .

At each step of the algorithm we finalise  $D(u)$  for some vertex  $u$ .

At the end of the algorithm all  $D(u)$  will be equal to the correct value,

# Dijkstra's Algorithm

For vertices  $x$  and  $y$ , this finds an  $\ell$ -shortest  $xy$ -path.

The idea of the algorithm is to maintain a 'tentative distance from  $x$ ' called  $D(v)$  for each  $v \in V(G)$ .

At each step of the algorithm we finalise  $D(u)$  for some vertex  $u$ .

At the end of the algorithm all  $D(u)$  will be equal to the correct value, i.e.  $D(u) = \ell(P_u^*)$  for some  $\ell$ -shortest  $xu$ -path  $P_u^*$ .

# Dijkstra's Algorithm

Start by letting  $U = V(G)$ ,  
[ $U$  is the set of vertices  $v$  for which  $D(v)$  has  
not yet been finalised]

# Shortest paths rooted trees

Dijkstra's Algorithm can be used to do more:

# Shortest paths rooted trees

Dijkstra's Algorithm can be used to do more:

For any  $x \in V(G)$  we can construct a spanning tree  $T$  such that for any  $y \in V(G)$ , the unique  $xy$ -path in  $T$  is an  $\ell$ -shortest  $xy$ -path.

# Shortest paths rooted trees

Dijkstra's Algorithm can be used to do more:

For any  $x \in V(G)$  we can construct a spanning tree  $T$  such that for any  $y \in V(G)$ , the unique  $xy$ -path in  $T$  is an  $\ell$ -shortest  $xy$ -path.

We call  $T$  an  *$\ell$ -shortest paths tree rooted at  $x$* .

# Shortest paths rooted trees

Dijkstra's Algorithm can be used to do more:

For any  $x \in V(G)$  we can construct a spanning tree  $T$  such that for any  $y \in V(G)$ , the unique  $xy$ -path in  $T$  is an  $\ell$ -shortest  $xy$ -path.

We call  $T$  an  *$\ell$ -shortest paths tree rooted at  $x$* .

# Shortest paths rooted trees

We now describe how to obtain  
 $T$ .

## Shortest paths rooted trees

We now describe how to obtain  $T$ .

For any vertex  $v \neq x$ , the *parent* of  $v$  is the last vertex  $u$  such that we replaced  $D(v)$  by  $D(u) + \ell(uv)$  during the algorithm.

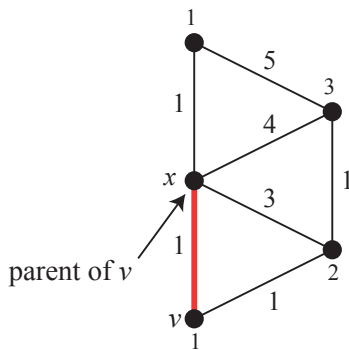

## Shortest paths rooted trees

We now describe how to obtain  $T$ .

For any vertex  $v \neq x$ , the *parent* of  $v$  is the last vertex  $u$  such that we replaced  $D(v)$  by  $D(u) + \ell(uv)$  during the algorithm.

We obtain  $T$  by drawing an edge from each vertex  $v \neq x$  to the parent of  $v$ .

## Shortest paths rooted trees

# Completion of the proof

Theorem 15.  $T$  is an  $\ell$ -shortest paths tree rooted at  $x$ .

Proof. For each  $u \in V(G)$  let  $D^*(u) = \ell(P_u^*)$  for some  $\ell$ -shortest  $xu$ -path  $P_u^*$ .

We show by induction that in each step of the algorithm, when  $u$  is deleted we have  $D(u) = D^*(u)$ .

Base case. We have  $u = x$  and  $D(u) = D^*(u) = 0$ .

Induction step. Consider the step where we delete some  $u$  from  $U$ , and suppose for contradiction that  $D(u) > D^*(u)$ .

# Completion of the proof

Theorem 15.  $T$  is an  $\ell$ -shortest paths tree rooted at  $x$ .

Proof. For each  $u \in V(G)$  let  $D^*(u) = \ell(P_u^*)$  for some  $\ell$ -shortest  $xu$ -path  $P_u^*$ .

We show by induction that in each step of the algorithm, when  $u$  is deleted we have  $D(u) = D^*(u)$ .

Base case. We have  $u = x$  and  $D(u) = D^*(u) = 0$ .

Induction step. Consider the step where we delete some  $u$  from  $U$ , and suppose for contradiction that  $D(u) > D^*(u)$ .

Let  $C = V(G) \setminus U$ . By induction, for every vertex  $v$  in  $T_C$ ,  $D^*(v) = D(v)$ .

## Completion of the proof

Let  $yy'$  be the first edge of  $P_u^*$  with  $y \notin U$  and  $y' \in U$ .

## Completion of the proof

Let  $yy'$  be the first edge of  $P_u^*$  with  $y \notin U$  and  $y' \in U$ .

By induction hypothesis  
 $D(y) = D^*(y)$ . Now

$$\begin{aligned} D(y') &\leq D(y) + \ell(yy') \\ &= D^*(y) + \ell(yy') \\ &= \ell(P_y^*) + \ell(yy') \\ &\leq \ell(P_u^*) = D^*(u) < D(u). \end{aligned}$$

## Completion of the proof

Let  $yy'$  be the first edge of  $P_u^*$  with  $y \notin U$  and  $y' \in U$ .

By induction hypothesis  
 $D(y) = D^*(y)$ . Now

$$\begin{aligned} D(y') &\leq D(y) + \ell(yy') \\ &= D^*(y) + \ell(yy') \\ &= \ell(P_y^*) + \ell(yy') \\ &\leq \ell(P_u^*) = D^*(u) < D(u). \end{aligned}$$

The first inequality uses the update rule for  $y$  and  $y'$ : when  $y$  was removed from  $U$ ,  $D(y')$  was replaced by  $D(y) + \ell(yy')$  if that was smaller, and so after this,  $D(y') \leq D(y) + \ell(yy')$ .

## Completion of the proof

Let  $yy'$  be the first edge of  $P_u^*$  with  $y \notin U$  and  $y' \in U$ .

By induction hypothesis  
 $D(y) = D^*(y)$ . Now

$$\begin{aligned} D(y') &\leq D(y) + \ell(yy') \\ &= D^*(y) + \ell(yy') \\ &= \ell(P_y^*) + \ell(yy') \\ &\leq \ell(P_u^*) = D^*(u) < D(u). \end{aligned}$$

The first inequality uses the update rule for  $y$  and  $y'$ : when  $y$  was removed from  $U$ ,  $D(y')$  was replaced by  $D(y) + \ell(yy')$  if that was smaller, and so after this,  $D(y') \leq D(y) + \ell(yy')$ .

However,  $y' \in U$  with  $D(y') < D(u)$  contradicts the choice of  $u$  in the algorithm. So  $D(u) = D^*(u)$ . □

## Running time

The running time of this implementation of Dijkstra's Algorithm is  $O(|V(G)||E(G)|)$ .

## Running time

The running time of this implementation of Dijkstra's Algorithm is  $O(|V(G)||E(G)|)$ .

A better implementation (which we omit) gives a running time of  $O(|E(G)| + |V(G)| \log |V(G)|)$ .

## Maximal size matchings

Lemma 16. Let  $M$  be a matching in  $G$ . Then  $M$  is not of maximum size if and only if there is an  $M$ -augmenting path in  $G$ .

## Maximal size matchings

Lemma 16. Let  $M$  be a matching in  $G$ . Then  $M$  is not of maximum size if and only if there is an  $M$ -augmenting path in  $G$ .

Proof. If there is an  $M$ -augmenting path  $P$  in  $G$  then we can find a larger matching by 'flipping'  $P$ : replace  $M$  by  $M \setminus (M \cap E(P)) \cup (E(P) \setminus M)$ .

## Maximal size matchings

Lemma 16. Let  $M$  be a matching in  $G$ . Then  $M$  is not of maximum size if and only if there is an  $M$ -augmenting path in  $G$ .

Proof. If there is an  $M$ -augmenting path  $P$  in  $G$  then we can find a larger matching by 'flipping'  $P$ : replace  $M$  by  $M \setminus (M \cap E(P)) \cup (E(P) \setminus M)$ .

Conversely, suppose that  $M^*$  is a matching in  $G$  with  $|M^*| > |M|$ .

## Maximal size matchings

Lemma 16. Let  $M$  be a matching in  $G$ . Then  $M$  is not of maximum size if and only if there is an  $M$ -augmenting path in  $G$ .

Proof. If there is an  $M$ -augmenting path  $P$  in  $G$  then we can find a larger matching by 'flipping'  $P$ : replace  $M$  by  $M \setminus (M \cap E(P)) \cup (E(P) \setminus M)$ .

Conversely, suppose that  $M^*$  is a matching in  $G$  with  $|M^*| > |M|$ .

Let  $H = M \cup M^*$ .

## Maximal size matchings

**Lemma 16.** Let  $M$  be a matching in  $G$ . Then  $M$  is not of maximum size if and only if there is an  $M$ -augmenting path in  $G$ .

**Proof.** If there is an  $M$ -augmenting path  $P$  in  $G$  then we can find a larger matching by 'flipping'  $P$ : replace  $M$  by  $M \setminus (M \cap E(P)) \cup (E(P) \setminus M)$ .

Conversely, suppose that  $M^*$  is a matching in  $G$  with  $|M^*| > |M|$ .

Let  $H = M \cup M^*$ .

Every vertex has degree at most 2 in  $H$ , so each component of  $H$  is an edge, path or cycle, the edge components consist of  $M \cap M^*$ , and the edges in path and cycle components alternate between  $M$  and  $M^*$ .

## Maximal size matchings

Lemma 16. Let  $M$  be a matching in  $G$ . Then  $M$  is not of maximum size if and only if there is an  $M$ -augmenting path in  $G$ .

Proof. If there is an  $M$ -augmenting path  $P$  in  $G$  then we can find a larger matching by 'flipping'  $P$ : replace  $M$  by  $M \setminus (M \cap E(P)) \cup (E(P) \setminus M)$ .

Conversely, suppose that  $M^*$  is a matching in  $G$  with  $|M^*| > |M|$ .

Let  $H = M \cup M^*$ .

Every vertex has degree at most 2 in  $H$ , so each component of  $H$  is an edge, path or cycle, the edge components consist of  $M \cap M^*$ , and the edges in path and cycle components alternate between  $M$  and  $M^*$ .

As  $|M^*| > |M|$  we can find a path component with more edges of  $M^*$  than  $M$ : this is an  $M$ -augmenting path in  $G$ .

## Finding a maximal size matching

Lemma 16 reduces the algorithmic question of finding a maximum matching in  $G$  to the following: given a matching  $M$  in  $G$ , find an  $M$ -augmenting path or show that there is none.

# Finding a maximal size matching

Lemma 16 reduces the algorithmic question of finding a maximum matching in  $G$  to the following: given a matching  $M$  in  $G$ , find an  $M$ -augmenting path or show that there is none.

We'll focus on the case of bipartite graphs.

# Finding augmenting paths in bipartite graphs

Now suppose that  $G$  is bipartite, with parts  $A$  and  $B$ .

# Finding augmenting paths in bipartite graphs

Now suppose that  $G$  is bipartite, with parts  $A$  and  $B$ .

Let  $M$  be a matching.

## Finding augmenting paths in bipartite graphs

Now suppose that  $G$  is bipartite, with parts  $A$  and  $B$ .

Let  $M$  be a matching.

We put directions on  $E(G)$ , so that all edges in  $M$  are one-way from  $B$  to  $A$ , and all edges not in  $M$  are one-way from  $A$  to  $B$ .

# Finding augmenting paths in bipartite graphs

Now suppose that  $G$  is bipartite, with parts  $A$  and  $B$ .

Let  $M$  be a matching.

We put directions on  $E(G)$ , so that all edges in  $M$  are one-way from  $B$  to  $A$ , and all edges not in  $M$  are one-way from  $A$  to  $B$ .

Let  $A^*$  and  $B^*$  be the vertices in  $A$  and  $B$  that are 'uncovered', i.e. not in any edge of  $M$ .

## Finding augmenting paths in bipartite graphs

Now suppose that  $G$  is bipartite, with parts  $A$  and  $B$ .

Let  $M$  be a matching.

We put directions on  $E(G)$ , so that all edges in  $M$  are one-way from  $B$  to  $A$ , and all edges not in  $M$  are one-way from  $A$  to  $B$ .

Let  $A^*$  and  $B^*$  be the vertices in  $A$  and  $B$  that are 'uncovered', i.e. not in any edge of  $M$ .

Then an  $M$ -augmenting path is equivalent to a directed path from  $A^*$  to  $B^*$ , i.e. a path that respects directions of edges.

## Finding a directed path

Is there a directed path from  $A^*$  to  $B^*$ ?

## Finding a directed path

Is there a directed path from  $A^*$  to  $B^*$ ?

**Suppose** that we had found a matching  $M$  and a cover  $C$  such that  $|M| = |C|$ .

Then we would know that  $M$  was a maximal size matching and  $C$  was a minimal size cover.

This is an example of 'weak duality'.

This suggests the question of whether equality holds. The answer to the question is 'no' in general:

The maximum matching has size 1 but the minimum cover has size 2.

# König's Theorem

König's Theorem. In any bipartite graph, the size of a maximum matching equals the size of a minimum cover.

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

Recall that we write  $A^*$  and  $B^*$  for the uncovered vertices in  $A$  and  $B$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

Recall that we write  $A^*$  and  $B^*$  for the uncovered vertices in  $A$  and  $B$ .

Consider the search algorithm for an  $M$ -augmenting path in  $G$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

Recall that we write  $A^*$  and  $B^*$  for the uncovered vertices in  $A$  and  $B$ .

Consider the search algorithm for an  $M$ -augmenting path in  $G$ . The algorithm terminates with some set  $R$  that consists of all vertices reachable by  $M$ -alternating paths starting in  $A^*$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

Recall that we write  $A^*$  and  $B^*$  for the uncovered vertices in  $A$  and  $B$ .

Consider the search algorithm for an  $M$ -augmenting path in  $G$ . The algorithm terminates with some set  $R$  that consists of all vertices reachable by  $M$ -alternating paths starting in  $A^*$ .

As  $M$  is maximum there is no  $M$ -augmenting path, so  $R \cap B^* = \emptyset$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

Recall that we write  $A^*$  and  $B^*$  for the uncovered vertices in  $A$  and  $B$ .

Consider the search algorithm for an  $M$ -augmenting path in  $G$ . The algorithm terminates with some set  $R$  that consists of all vertices reachable by  $M$ -alternating paths starting in  $A^*$ .

As  $M$  is maximum there is no  $M$ -augmenting path, so  $R \cap B^* = \emptyset$ .

Let  $C = (A \setminus R) \cup (B \cap R)$ .

# Proof

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Let  $M$  be a maximum matching in  $G$ .

It suffices to find a cover  $C$  with  $|C| = |M|$ .

Recall that we write  $A^*$  and  $B^*$  for the uncovered vertices in  $A$  and  $B$ .

Consider the search algorithm for an  $M$ -augmenting path in  $G$ . The algorithm terminates with some set  $R$  that consists of all vertices reachable by  $M$ -alternating paths starting in  $A^*$ .

As  $M$  is maximum there is no  $M$ -augmenting path, so  $R \cap B^* = \emptyset$ .

Let  $C = (A \setminus R) \cup (B \cap R)$ .

We claim that  $C$  is a cover with  $|C| = |M|$ .

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

We start by showing that  $C$  is a cover.

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

We start by showing that  $C$  is a cover.

Suppose not. Then there is  $ab \in E(G)$  with  $a \in A \cap R$  and  $b \in B \setminus R$ .

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

We start by showing that  $C$  is a cover.

Suppose not. Then there is  $ab \in E(G)$  with  $a \in A \cap R$  and  $b \in B \setminus R$ .

However, this contradicts the definition of  $R$ , as  $b$  must be reachable from  $A^*$ : if  $ab \in M$  we must reach  $a$  via  $b$  or if  $ab \notin M$  we can reach  $b$  via  $a$ .

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

We start by showing that  $C$  is a cover.

Suppose not. Then there is  $ab \in E(G)$  with  $a \in A \cap R$  and  $b \in B \setminus R$ .

However, this contradicts the definition of  $R$ , as  $b$  must be reachable from  $A^*$ : if  $ab \in M$  we must reach  $a$  via  $b$  or if  $ab \notin M$  we can reach  $b$  via  $a$ .

Thus  $C$  is a cover.

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

It remains to show  $|C| = |M|$ .

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

It remains to show  $|C| = |M|$ .

It suffices to show that every vertex in  $C$  is covered by some edge of  $M$ , and that no edge of  $M$  covers two vertices of  $C$ .

## Proof

$$C = (A \setminus R) \cup (B \cap R).$$

It remains to show  $|C| = |M|$ .

It suffices to show that every vertex in  $C$  is covered by some edge of  $M$ , and that no edge of  $M$  covers two vertices of  $C$ .

(This will show  $|C| \leq |M|$ , and we noted previously that  $|M| \leq |C|$  is immediate from the definitions.)

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

It remains to show  $|C| = |M|$ .

It suffices to show that every vertex in  $C$  is covered by some edge of  $M$ , and that no edge of  $M$  covers two vertices of  $C$ .

(This will show  $|C| \leq |M|$ , and we noted previously that  $|M| \leq |C|$  is immediate from the definitions.)

Firstly, any  $a \in A \setminus R$  is covered by  $M$  as  $A^* \subseteq R$ .

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

It remains to show  $|C| = |M|$ .

It suffices to show that every vertex in  $C$  is covered by some edge of  $M$ , and that no edge of  $M$  covers two vertices of  $C$ .

(This will show  $|C| \leq |M|$ , and we noted previously that  $|M| \leq |C|$  is immediate from the definitions.)

Firstly, any  $a \in A \setminus R$  is covered by  $M$  as  $A^* \subseteq R$ .

Secondly, any  $b \in B \cap R$  is covered by  $M$ , or  $b \in B^* \cap R = \emptyset$  gives a contradiction.

# Proof

$$C = (A \setminus R) \cup (B \cap R).$$

It remains to show  $|C| = |M|$ .

It suffices to show that every vertex in  $C$  is covered by some edge of  $M$ , and that no edge of  $M$  covers two vertices of  $C$ .

(This will show  $|C| \leq |M|$ , and we noted previously that  $|M| \leq |C|$  is immediate from the definitions.)

Firstly, any  $a \in A \setminus R$  is covered by  $M$  as  $A^* \subseteq R$ .

Secondly, any  $b \in B \cap R$  is covered by  $M$ , or  $b \in B^* \cap R = \emptyset$  gives a contradiction.

Finally, if  $ab \in M$  with  $a \in A \setminus R$ ,  $b \in B \cap R$  then we can reach  $a$  via  $b$ , contradicting  $a \notin R$ . Thus  $|C| = |M|$ .

□

# The marriage problem

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ .

# The marriage problem

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ .

We consider the more general question of whether there is a matching that covers every vertex in  $A$ ; if  $|B| = |A|$  then this will be perfect.

# The marriage problem

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ .

We consider the more general question of whether there is a matching that covers every vertex in  $A$ ; if  $|B| = |A|$  then this will be perfect.

For  $S \subseteq A$  the *neighbourhood* of  $S$  is

$$N(S) = \bigcup_{a \in S} \{b : ab \in E(G)\}.$$

# The marriage problem

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ .

We consider the more general question of whether there is a matching that covers every vertex in  $A$ ; if  $|B| = |A|$  then this will be perfect.

For  $S \subseteq A$  the *neighbourhood* of  $S$  is

$$N(S) = \bigcup_{a \in S} \{b : ab \in E(G)\}.$$

Note that if  $G$  has a matching  $M$  covering  $A$  then each  $a \in S$  has a 'match'  $a'$  with  $aa' \in M$ , and the matches are distinct, so  $|N(S)| \geq |S|$ .

# The marriage problem

Let  $G$  be a bipartite graph with parts  $A$  and  $B$ .

We consider the more general question of whether there is a matching that covers every vertex in  $A$ ; if  $|B| = |A|$  then this will be perfect.

For  $S \subseteq A$  the *neighbourhood* of  $S$  is

$$N(S) = \bigcup_{a \in S} \{b : ab \in E(G)\}.$$

Note that if  $G$  has a matching  $M$  covering  $A$  then each  $a \in S$  has a 'match'  $a'$  with  $aa' \in M$ , and the matches are distinct, so  $|N(S)| \geq |S|$ .

This gives a necessary condition for  $G$  to have a matching; it is also sufficient ...

# The marriage problem

Hall's Theorem. Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Then  $G$  has a matching covering  $A$  if and only if every  $S \subseteq A$  has  $|N(S)| \geq |S|$ .

# The marriage problem

Hall's Theorem. Let  $G$  be a bipartite graph with parts  $A$  and  $B$ . Then  $G$  has a matching covering  $A$  if and only if every  $S \subseteq A$  has  $|N(S)| \geq |S|$ .

Proof.

# The marriage problem

Then  $|C| = |A \cap C| + |B \cap C| \geq |A| - |S| + |N(S)| \geq |A|$ .

# The Chinese Postman Problem

# The Chinese Postman Problem

A postman collects a sack of letters from the sorting office, walks along every street to deliver them, and returns to the office. How can (s)he find the shortest route?

# The Chinese Postman Problem

A postman collects a sack of letters from the sorting office, walks along every street to deliver them, and returns to the office. How can (s)he find the shortest route?

Let  $G$  be a connected graph. Let  $W$  be a closed walk in  $G$ .

# The Chinese Postman Problem

A postman collects a sack of letters from the sorting office, walks along every street to deliver them, and returns to the office. How can (s)he find the shortest route?

Let  $G$  be a connected graph. Let  $W$  be a closed walk in  $G$ . We call  $W$  a *postman walk* in  $G$  if it uses every edge of  $G$  at least once.

# The Chinese Postman Problem

A postman collects a sack of letters from the sorting office, walks along every street to deliver them, and returns to the office. How can (s)he find the shortest route?

Let  $G$  be a connected graph. Let  $W$  be a closed walk in  $G$ . We call  $W$  a *postman walk* in  $G$  if it uses every edge of  $G$  at least once.

For each  $e \in E(G)$  let  $c(e) > 0$  be the length of  $e$ . The length of  $W$  is  $c(W) = \sum_{e \in W} c(e)$ .

# The Chinese Postman Problem

A postman collects a sack of letters from the sorting office, walks along every street to deliver them, and returns to the office. How can (s)he find the shortest route?

Let  $G$  be a connected graph. Let  $W$  be a closed walk in  $G$ .

We call  $W$  a *postman walk* in  $G$  if it uses every edge of  $G$  at least once.

For each  $e \in E(G)$  let  $c(e) > 0$  be the length of  $e$ . The length of  $W$  is  $c(W) = \sum_{e \in W} c(e)$ .

We want to find a shortest postman walk.

# Extensions

# Extensions

# Extensions

We can interpret a postman walk  $W$  as an Euler Tour in an *extension* of  $G$ , in which we introduce parallel edges, so that the number of parallel edges joining vertices  $x$  and  $y$  is the number of times that  $xy$  is used in  $W$ .

# Extensions

We can interpret a postman walk  $W$  as an Euler Tour in an *extension* of  $G$ , in which we introduce parallel edges, so that the number of parallel edges joining vertices  $x$  and  $y$  is the number of times that  $xy$  is used in  $W$ .

Thus an equivalent reformulation of the Chinese Postman Problem is to find a *minimum weight Eulerian extension*  $G^*$  of  $G$ , i.e.  $G^*$  is obtained from  $G$  by copying some edges, so that all degrees in  $G^*$  are even, and  $c(G^*)$  is as small as possible.

# Edmonds' algorithm

We will describe an algorithm due to Edmonds.

# Edmonds' algorithm

We will describe an algorithm due to Edmonds.

We **assume** that we have access to an algorithm for finding a minimum weight perfect matching in a weighted graph.

# Edmonds' algorithm

We will describe an algorithm due to Edmonds.

We **assume** that we have access to an algorithm for finding a minimum weight perfect matching in a weighted graph.

(An algorithm for this problem was also found by Edmonds, but it is beyond the scope of this course).

Theorem 20. Edmonds' Algorithm finds a minimum length postman walk.

Let  $H' \subseteq H$  be the graph formed by the union of these paths.

Let  $G'$  be the Eulerian extension of  $G$  defined by copying the edges of  $H'$ .

Let  $W'$  be an Euler tour in  $G'$ , interpreted as a postman walk in  $G$ . Then  $c(W') \leq c(W^*)$ .

# Edmonds' algorithm works

Theorem 20. Edmonds' Algorithm finds a minimum length postman walk.

Let  $H' \subseteq H$  be the graph formed by the union of these paths.

Let  $G'$  be the Eulerian extension of  $G$  defined by copying the edges of  $H'$ .

Let  $W'$  be an Euler tour in  $G'$ , interpreted as a postman walk in  $G$ . Then  $c(W') \leq c(W^*)$ .  
By definition of the algorithm it finds a postman walk that is no longer than  $W'$ .  $\square$
